Prof. Dr. med. Robert Heaney

<http://prof-dr-med-robert-heaney.webnode.com/>

The nutritional/enzyme cancer treatment developed by the alternative practitioner Dr. William Donald Kelley. In this book, you will read why Dr. Kelley believed no one ideal diet suits everyone and how he developed ten basic diets for his patients ranging from vegetarian to carnivore. You will also learn the underlying rationale for Dr. Kelley's precise use of nutritional supplements including pancreatic enzymes, which provided the main anti-cancer effect of his therapy. The book also discusses the various "detoxification" routines prescribed by Dr. Kelley, such as coffee enemas, which he claimed helped neutralize the effects of dead tumor wastes that accumulate during treatment.

Dr. William Donald Kelley contended this cancer protocol had a 93 percent cure rate on *newly diagnosed* cancer patients, even including pancreatic cancer and liver cancer. How could it be that successful? The Kelley enzymes strip the unique protein coating off of cancer cells so the immune system can identify and kill the cancer cells.

Dr. Kelley and his practitioners treated more 33,000 patients, claiming a 93 percent success rate for those who came to him first — not after chemotherapy, radiation, or surgery. For those with a predicted life expectancy of about three months, he said that a well-designed nutritional program would yield “slightly better than a 50-50 chance of survival.” For those with a very advanced disease, given less than three months to live, he claimed a success rate between 25 and 35 percent.

Dr. Kelley talked of the pancreas as being one of the main organs in defense of cancer. Why would he say that? The pancreas works with the liver to regulate insulin (a hormone) and it produces many enzymes (more than 30) and some of them dissolve protein, such as those on the outside of cancer cells.

Dr. Kelley learned this perspective from the famous embryologist John Beard, who worked at the University of Edinburgh at the

turn of the 20th century. He first proposed in 1906 that pancreatic proteolytic enzymes, in addition to their well-known digestive function, represent the body's main defense against cancer.

Dr. Kelley, and Beard before him, believed to defeat cancer you don't create some new method of defense that does not mimic the human body, you create a method of defense that acts like the human body, and the body uses pancreatic proteolytic enzymes in the natural fight against cancer.

What makes enzymes function well in the body are trace minerals and hormone balance, so Dr. Kelley provided support for both in his program. Dr. Kelley always said you have to bring the body back to homeostasis; that does not entail large dosages of strange items being put into the body. What does he mean by that?

High-dose Vitamin C can disrupt enzyme function. That is why Dr. Kelley did not use high dose Vitamin C. He did believe the body needed plant enzyme function, so he endorsed and recommended high-dose juicing of specific vegetable combinations, and he worked to rebuild the glandular function of the body with glandular supplements, until the body could provide its own glandular support.

Dr. Kelley saw a close correlation between diabetes and cancer and treated both in a similar fashion. Anyone who came to Dr. Kelley with cancer often had diabetes, and both were cured with his program. Dr. Kelley believed you had to detox very aggressively. He believed you could not aggressively kill cancer cells in a body already full of toxins or you contributed to a state of cachexia.

So part of his program was an aggressive detox program, done in sequence, very carefully. He said you should wait six months before doing a gallbladder flush or you may put a patient into a healing crisis they cannot handle.

## Important Warning

The Kelley Protocol is not just taking enzymes but is a complete program that evaluates all aspects of a person with metastatic disease like cancer. It should be combined with a major cancer treatment, generally the Collect-Budwig protocol.

There are two vendors of the enzymes. Study both websites and pick one. Remember, vendors cannot make medical claims:

Vendor No. 1 and consultant of the Kelley enzymes, knows which ones to use and how to incorporate the enzymes without risk: Dr. Kelley Enzymes (Dale Maxwell)

Vendor No. 2 is Wade Lighthouse who has written a book on enzymes and sells the enzymes: MVP-Maximum Viral Power (Wade Lighthouse)

- Interview with Ty Bollinger and Wade Lighthouse

Why would it be important to combine the enzymes with the Collect-Budwig protocol? It should be clearly understood that the 93 percent cure rate of Dr. Kelley was on cancer patients who were *newly diagnosed*. Typically, the cure rate on cancer patients who have had significant chemotherapy, radiation, and/or surgery is only half of the cure rate for newly diagnosed cancer patients.

That is why the Kelley Protocol must be part of a complete protocol. If you cannot afford the enzymes and the Collect-Budwig, then use the enzymes with the Dirt Cheap Protocol .

### 'One Man Alone'

Dr. Nicholas Gonzalez's book One Man Alone covers many of the worst Stage IV cancer patients Dr. Kelley helped cure with his program. The five years of study of the Dr. Kelley program convinced Dr. Gonzalez to follow the lead of Dr. Kelley, who

died on Jan. 30, 2005. His Metabolic Nutrition Group is still active, however.

Dr. Gonzalez received his medical degree from Cornell University Medical College in 1983. During a post graduate immunology fellowship under Dr. Robert A. Good, considered the father of immunology, he completed a research study evaluating an aggressive nutritional therapy in the treatment of advanced cancer.

In private practice in New York City from 1987, Dr. Gonzalez treated patients diagnosed with cancer and other serious degenerative illnesses. His Gonzalez protocol is based on the belief that pancreatic enzymes are the body's main defense against cancer and can be used as a treatment.

Dr. Gonzalez's nutritional research received substantial financial support from Proctor and Gamble and Nestlé. Results from a pilot study published in 1999 described the most positive data in the medical literature for pancreatic cancer. He died July 21, 2015.

### Summary Comments

Dr. Kelley, and the current Kelley-trained doctors are fond of saying, “If you have the will to live, the faith to survive, and the intelligence to think on your own, you have a good chance of survival with the Kelley program. Healing is not for the weak of heart or those with a lack of faith.”

Life Clinic (Kelley Protocol) in Hong Kong is a full-service clinic specializing in Kelley.

[Cancer - A review of the Nutritional Therapies in the Management of Cancer.](#)

Cancer results from an uncontrolled growth of abnormal cells in the body. As the cells continue to divide they form into cancerous tumors. The frenzied development of a cancerous tumor can overwhelm the organ or tissue where it is located. Left unchecked, many cancers can eventually destroy enough tissue that the body loses its ability to sustain life.

Although the potential causes of cancer are numerous, they can be placed into these basic categories:

- Genetics + family history (5-10%)
- Environmental influences (25%)
- Dietary habits, Lifestyle Factors eg. Sleep, exercise, stress management (75%)

The key message to understand here is that we have more control over the development of cancer than first thought. Traditionally it was believed that cancer was 'in our genes' and it was pre-determined, however it is now becoming clearer that by modifications to diet and lifestyle can dramatically reduce your risk of getting cancer. An example is by not smoking or being around smokers you can substantially reduce your risk of getting lung cancer.

The typical western diet of high carbs and low fats, promotes obesity and thereby contributes to the development of cancer. A poor diet fails to nourish the anti-cancer systems of the body. Cancer promoting foods like refined sugar, excess carbohydrates, bad fats and certain meats all have their role to play in weakening immunity, promoting an inflammatory response, disrupting sugar metabolism and stimulating the release of cancer promoting hormones.

The bodys ability to heal

The human body is actually designed to win the battle against cancer. Most of us have circulating cancer cells – the only reason we don't have a diagnosis of cancer is because we have been successful in destroying and eliminating these cancerous cells. We each have body systems, immune cells and pathways set up to help prevent and defeat cancer. Diet, lifestyle, the external environment and genetic make-up all influence the bodys' ability to fight cancer.

Existing cancer treatments like chemotherapy and radiotherapy severely underestimates the bodys' potential for self-healing. The body has an innate system of checks and balances that work to keep us strong. This primarily is the immune system which is supported by the detoxification system. We have over 1 trillion

white blood cells circulating the body, which are composed of anti-bodies, lymphocytes, T cells, Natural Killer Cells, macrophages and others to form a formidable anticancer team.

An important factor in remaining disease free is maintaining or creating a healthy environment. Unfortunately aspects of our environment are directly damaging to cells. The air you breathe, the water you drink, the food you eat and the chemicals you touch can create cellular damage. Many environmental factors can make a person more vulnerable to cancer and they are called carcinogens.

Reassuringly there are some proactive steps one can take through diet and lifestyle to help prevent cancer. Although cancer is a disease of genetic expression, it can be mitigated through modifications of the diet, how much weight we carry or changing our external environment.

The kind of food we eat has a big impact on health. Proactive cancer prevention places the emphasis on whole fresh and fermented foods which provide essential cancer fighting nutrients. Some food contains significant nutrients that help keep the body healthy and operating at peak capacity. These include:

- *Tomatoes* – contain lycopene which supports the immune system.
- *Whole grains* – contain lignans which positively influence the hormonal system.
- *Citrus fruits* – contain flavonoids which enhance immunity.
- *Broccoli* – contain sulforaphane and other compounds that help stimulate detoxification and immunity
- *Rosemary* - contain Carnisol and other aromatic compounds that can help prevent and treat cancer.

When it comes to the macro-nutrients its important to ensure an adequate balance of carbohydrates proteins and fats. Maintaining good levels of healthy fats is important which include monounsaturated fats and polyunsaturated fats. Some saturated fat

is ok, as is good levels of Essential Fatty Acids (EFAs) particularly Omega-3s which have been shown to be effective against reducing cancer by increased apoptosis (cell death).

Protein is essential for people with cancer, it can help to boost white blood cell counts and overall immunity. Undergoing conventional cancer therapy may require as much as 50% more protein than usual and one way of ensuring adequate protein intake is through protein shakes. The form of powdered protein provides a readily assimilated form of protein which can be quickly used by the body.

Among the essential amino acids, glutamine is especially important. Not only is it the most abundant amino acid in the body but its also involved in more metabolic tasks than other amino acids. It is especially important as a source of fuel for white blood cells and for cells that divide rapidly, like those in the small intestine. As an adjunctive support to help patients recover from chemotherapy and radiotherapy, glutamine is very supportive.

The scientific evidence linking vegetable and fruit intake to cancer prevention and treatment is impressive. Studies have shown that vegetables in the diet improve immune function and strengthen liver detoxification. Compounds in vegetables help protect DNA from damage that would otherwise lead to cancer.

### What promotes cancer growth

Certain metabolic changes in the body promote cancer growth and initiation, these include anaerobic metabolism (low oxygen), an acidic environment and a glucose rich diet.

#### Anerobic Metabolism

Normal cells typically create energy via a process known as aerobic metabolism (with oxygen). However, if something happens which either inhibits the bloods ability to transport oxygen, lowers the amount of oxygen in the blood or damages the cells ability to

make energy, then cells have no energy and this creates a problem. Since there is not enough oxygen for the cells to breathe, it changes to anaerobic (without oxygen) respiration to survive. The cell stops breathing and starts fermented glucose to make energy, the by product of which is lactic acid, which further inhibits the cell from receiving oxygen. This is the essential requirement that turns normal cells that depend on aerobic respiration into cancer cells which are anaerobic dependent.

Dr Otto Warburg, a cancer biochemist, initially discovered in the 1930's that cancer cells are anaerobic. He believed that cancer occurs whenever any cell is denied 60% of its oxygen requirement. His research indicated that cancer is a fermentative disease caused by cells which have mutated from aerobic respiration to anaerobic respiration.

### The pH Balance

Our blood must always maintain a pH of approximately 7.35 so that it can continue to transport oxygen. We have an in-built buffer system which allows the correction of an imbalanced pH so that we can continue to supply oxygen where needed. However when our buffering systems reach overload, excess acids are dumped into the tissues, as this continues tissues begin to deteriorate. The acid wastes begin to oxidise the veins and arteries and begin to destroy cell walls.

Normal cells create energy via aerobic respiration and cells which are alkaline are able to absorb sufficient quantities of oxygen to support aerobic respiration. However when cells become more acidic less oxygen is absorbed and the cells begin to ferment glucose in order to survive. Cancer cells thrive in an acidic environment and don't do well in an alkaline environment. So good advice would be to support the body with alkaline rich foods such as most vegetables and fruits, olive oil, green tea, raw cheese and avoid too much acidic forming foods – like sodas, coffee, alcohol, chocolate, meats, chicken and processed grains.

## A review of the nutritional therapies for cancer

A variety of nutritional therapies for cancer have sprung up in the last few decades. Some are gaining in popularity and credibility due to their long term effectiveness against cancer, whilst others are being falsely purported by celebrities and alternative practitioners who have particular vested interests in such therapies. Establishing a clear unbiased opinion of the true effectiveness of a nutritional therapy requires an objective case-by-case review, understanding the therapeutic action of each element of the nutritional protocol. I shall review the three most common nutritional therapies used for cancer.

### Budwig Diet

Back in the 1950s, a German Biochemist, Dr Joanna Budwig, began to study the effects of fats on human metabolism. She began her research by analysing the blood samples of thousands of ill patients, and she then compared these samples to the blood of healthy people. She soon found that the blood of seriously ill cancer patients was deficient in certain essential ingredients, including phosphatides and lipoproteins, whereas the blood of a healthy person contained sufficient quantities of these ingredients.

Budwig believed that chronic disease (cancer) is a result of a body lacking in Essential Fatty Acids (EFAs) which are full of electrons and bind to oxygen and proteins. When they are absorbed into the cell wall they pull oxygen into the cell, and when bound to sulphur based proteins they become water soluble. This is the theory behind budwig diet: The use of oxygen in the organism can be stimulated by lipoproteins (sulphur rich proteins found in cottage cheese and linoleic acid – EFA) and oxygen is the nemesis to cancer.

This protocol encourages the consumption sulphur-rich foods like nuts, onions, chives, garlic, and especially cottage cheese and yogurt. The budwig protocol also emphasises optimal detoxification with liver cleanses, infra-red saunas and coffee

enemas to be used regularly. Many foods are eliminated on the diet, including all pork, fish, sugars, animal fats and processed foods. She emphasises that the any foods should be prepared fresh and eaten straight away. This is to ensure that the consumption of the enzymes in the foods are utilised..

## DR Kelley Enzyme Therapy

Dr. Kelley was an orthodontist practicing in Texas in the 1960's. He was diagnosed with stage IV pancreatic cancer and was told by the oncologist at the time that there was no treatment effective enough to beat the cancer. Dr. Kelley then started experimenting with his diet, and consuming various proteolytic enzymes (protein digesting) and he noticed that his symptoms were going away. He tweaked and modified his therapy over time to include the detoxification procedures of coffee enemas, liver cleanses and infra-red saunas. He eventually cured himself of his cancer and started to apply the protocol he created to patients in the local area and soon he started to develop a reputation for helping people beat their cancer. The key difference of Dr. Kelleys protocol to Gerson and Budwigs protocols is the intensive use of proteolytic enzymes in the therapy together with the supplementation of amino-acids to support the immune system. Combining the enzymes with the amino acids is believed to have a specific role to play in weakening and breaking down the cancer cells and exposing them the immune system which provides further support in causing cancer cell apoptosis (cell death).

Today the protocol is modified to include other supplements which upregulate the immune system and optimise gut function. The dietary approach restricts red meat, chicken turkey and pork but allows some eggs and salmon to be moderately eaten. There is strong emphasis on eating liver daily, fresh vegetables together with nuts, seeds and some specific fruits.

## Gerson Therapy

The Gerson therapy, developed by Dr. Max Gerson in the 1930's, is longest existing nutritional cancer treatment available today. Dr. Gerson, a German physician who moved to New York in the 1930s started treating cancer patients in the 1940's. He was getting some good successes with patients reversing their cancer conditions and he declared that he had found a cure for cancer, declaring publically on national radio. He came under increasing scrutiny by the medical establishment and was later condemned by the New York state medical society.

According to Dr. Gerson, cancer is the result of two things: deficiency and toxicity. Gerson believed that cancer could be reversed if the patient cleansed their bodies from toxins which have built up over time and restore the immune system with proper nutrition. The dietary principles are one of rejuvenation with providing the body with micro-nutrients from a fat-free organic, vegetarian food diet with 13 pressed fruit juices per day. An abundance of nutrients from copious amounts of fresh, organic juices are providing your body with a super-dose of enzymes, minerals and nutrients. These substances then break down diseased tissue in the body, while coffee enemas aid in eliminating toxins from the liver.

The diet, which includes three full vegetarian meals, freshly prepared from organically grown fruits, vegetables and whole grains are consumed daily. A typical meal will include salad, cooked vegetables, baked potatoes, a 'Hippocrates soup' and juice. Supplements included are a potassium compound, Lugol's solution (iodine), Vitamin B-12, Thyroid hormone and Pancreatic Enzymes. Amino acids are very restricted on this diet in that no nuts, seeds, meats, poultry or fish are allowed.

Coffee enemas are the primary method of detoxification of the tissues and blood on the Gerson Therapy. Cancer patients on the Gerson Therapy may take up to 5 coffee enemas per day. The Gerson Therapy also utilizes castor oil to stimulate bile flow and enhance the liver's ability to filter blood.

## Life Clinic Says:

A common theme in all these nutritional approaches is that they all recognise toxicity as one of the contributing factors in cancer development, and by optimising detoxification through coffee enemas, infra red saunas or colon cleanses improves the elimination of toxins from the body.

The differences which are apparent between the protocols are related to amount and types of supplements consumed and the macro-nutrient ratios advised. Gerson advises a low fat low protein high carbohydrate intake approach. Budwig and Kelley advise a more balanced protein fat carbohydrate intake with Kelley advising more coconut milk and oil. Kelleys supplementation guidelines include a wider variety of nutrients compared to Budwig and Gerson. The supplements Dr. Kelley recommends are designed to boost immunity, strengthen organ function and increase detoxification in the body.

The key distinction between the protocols however is the clinical diagnostic testing which the Kelley protocol now applies to assist in customising the supplementation. This improves the efficacy of the overall protocol in combating the cancer.

Each of these protocols have had their own degrees of success in helping patients with cancer and deciding which protocol to go for is a personal decision. At LIFE clinic we are offering the Dr. Kelley Nutritional protocol as we feel it is a more complete program supporting the body in fighting the cancer.

## Nutritional Cancer Therapy

Why a Nutritional Program for cancer?

Conventional treatments for cancer have improved over the last 10 years and together with earlier detection methods have

increased the survival time of patients. However, the statistics are still poor for long term survival if the cancer returns or the cancer is too advanced. In addition, the mainstay treatments used (chemotherapy and radiotherapy) weaken the body in many aspects, including the immune system, the gastro-intestinal system and the general metabolism.

When using a nutritional philosophy to fight cancer, a different approach is used, an approach which treats the whole person and not just the disease. When this approach is adopted the body is strengthened and the immune system is supported. The triggers to what causes the cancer is addressed, which can include hormonal imbalances, toxicities and nutrient deficiencies. Our Nutritional Program for cancer is based on Dr. Kelley's Protocol, which has been applied by pioneering medical professionals for over the last 50 years in both the United States and Germany.

### Background on Dr Kelley's Nutritional Cancer Program

Dr. William Donald Kelley, DDS, MS: back in the 1960's when Dr. Kelley was diagnosed with stage IV pancreatic cancer, he applied a specific enzyme and nutritional protocol and he remained cancer-free for 30 years. Following this revelation of curing himself, Dr. Kelley treated thousands of cancer patients over three decades with the same protocol achieving amazing long-term survival records.

### What are the advantages of the Dr Kelley's Cancer Protocol?

- The protocol builds and strengthens the body's own immunity to help defeat the cancer. By the use of various protein-digesting enzymes, immune supporting supplements and foods we can regulate the body's own immune system to attack the cancer and help break it down.
- The protocol strengthens and optimizes the organs of detoxification. A key part of defeating the cancer is

ensuring firstly the organs of detoxification, namely the liver, colon and skin, are optimized and supported, and that detoxification occurs daily. This eliminates the breakdown products of cancer and speeds up the healing process.

- The use of medical and functional laboratory testing to help identify the triggers and nutritional imbalances which contribute to cancer formation are crucial to stopping its return. We utilize a variety of laboratory tests which evaluate organ function, heavy metal toxicity and nutrient deficiencies. Once the markers are identified we can tailor make and more specific nutritional protocol to support the organs, correct the deficiencies and eliminate the toxins.
- Weekly consultations for six months from a Clinical Nutritionist provides the necessary guidance in modifying and correcting the protocol. As the protocol takes effect, various small changes to the protocol do occur applying these changes requires close monitoring and weekly support.
- The dietary and supplementary protocol inhibits cancer growth at tissue level. Cancer loves acidic and high glucose environments to survive and grow. Creating a environment where the cancer is hindered to grow supports long-term health and well-being of the cancer patient.

How long does the program last?

The program lasts for an initial 6 months, after which a decision is made to continue for another 6 months depending on the progress of the patient.

Can I continue with conventional treatment whilst doing the Dr Kelley's Cancer Program?

For the Dr Kelley's Cancer Program to have optimal benefit, all conventional treatment needs to have been completed or ceased for at least 2 weeks.

How is the Dr Kelley's Cancer Program different to other nutritional protocols which help defeat cancer?

The key advantages of Dr Kelley's Protocol over the other two main nutritional programs which help against cancer, the *Budwig* and *Gerson* therapies, is the range of enzymes used in the therapy, the types of supplements used to optimize immune system function and the diagnostic approaches to identifying the triggers which cause the cancer to grow. *Dr Kelley's* program uses a variety of different enzymes which have been optimized over the years to have maximal effect on the cancer. The additional supplements which are used to regulate immune system function have been carefully selected and synergistically tested to ensure optimal function is achieved.

When a cancer is in remission careful monitoring is required to ensure no future re-growth occurs. Conventional marker testing sometimes misses the point where cancer starts developing. With our sensitive cancer marker testing, we investigate the 'environment' whereby cancer develops and this is more sensitive to the cancers re-growth than conventional markers, therefore we can catch the cancer at an earlier stage of development.

## Rationale

The protocol involves three essential components:

- Diet
- Supplementation
- Detoxification

The rationale of Dr Kelley's Nutritional Programme is to:

1. Break down the cancer cells – through the use of enzymes and immune system support.
2. Off-load the toxic burden within the body which contributes to cancer formation.
3. Building and strengthening the body's immune system, gut function and overall metabolism with specific diet and supplementary recommendations.

## Diet

The individual diets may include salmon, organic eggs, vegetables, nuts and seeds, legumes, sprouts and berries. No canned or processed foods are allowed. The diet focuses on re-building the body's ability to fight the cancer and also specifically supporting organs and systems which are weakened by conventional cancer treatment. These include primarily the liver and the gastrointestinal system.

## Supplementation – Enzymes

Specialized pancreatic enzymes are the cornerstone of our supplementation program. Enzymes work by travelling through the bloodstream to the site of the tumor and digesting the specific protein of the tumor mass without harming the body's healthy tissues.

## Detoxification routines

Optimal detoxification is essential for health. Our cells continuously produce metabolic wastes and we ingest through air, food and water variety of toxins which need to be metabolized and excreted via the liver and kidneys every day. With Cancer there is an additional burden with the breakdown of cancer cells and their subsequent elimination. Supporting the detoxification pathways of the body will not only rid the body of various toxins which contribute to the cancer but also to cleanse the body of the cancers breakdown constituents.

We incorporate a wide range of detoxification options in an individualized program, including liver support, gallbladder flush, coffee enemas and infrared sauna.

Nutritional / medical assessments include:

- ❑ Amino-acid plasma/ blood spot: assessment of amino-acids
- ❑ Cancer profile markers: non-specific markers
- ❑ Thyroid complete panel
- ❑ Liver detoxification function
- ❑ Comprehensive metabolic profile - liver and kidney function
- ❑ Red cell mineral test: assessment of essential minerals and toxic metals
- ❑ Fecal metal test: assessment of heavy metals clearance from the body.

**\* THIS NUTRITIONAL PROGRAM IS NOT A SUBSTITUTE FOR QUALITY MEDICAL CARE. IT IS IMPERATIVE THAT YOU SEE AN ONCOLOGIST AND REVIEW YOUR OPTIONS.**

Are we getting enough nutrients in our daily diet?

*By Miles Price, Certified Holistic Nutritionist*

Obtaining all the nutrients we need through our diet is much more challenging now than it was 50 years ago. We strive to make the right choices when presented with the freshest organic

vegetables for example, but with high organic prices, limited stock availability coupled with long storage times, do we actually get what we believe we are supposed to be getting? Or do we just turn a blind eye to food quality and eat our veggies without a regard to how it's produced?

In 2000, 'Organic Magazine' compared nutrient values of foods as listed by the USDA in 2000 with those listed in 1963. Here is a sample of the decline they found:

*In a cross section of vegetables, including Beets, Spinach, Corn and Collards, Vitamin C declined an average 50%, Magnesium declined 15-80% and Potassium declined 10-40%.*

In Anne-Marie Mayes' British study in 1997 called "Historical Changes in the Mineral Content of Fruits and Vegetables", she identified that there are "*statistically significant reductions in the levels of Calcium, Magnesium, Copper, and sodium in vegetables and of Magnesium, Iron, Copper and Potassium in fruit.*"

This is troubling news for people who are trying to eat a balanced diet. Even healthy foods, like fresh fruits and vegetables, may not be as healthy as they once were.

Who is to blame?

The majority of farmers in the western world have dramatically changed their farming practices in the last 40 years, and use crop varieties which achieve higher yields and economic gains, but without the nutritional gains. As a result our food contains fewer nutrients when they come out of the soil, and when they are processed these nutrients are further depleted. The organic movement is trying to redress the balance, however as its production accounts for only 10-15% of the total market supply, the majority of us need to be reassured about the conventional methods of farming.

Specific Reasons for Nutrient depletion in fruits and vegetables include:

1. Depletion of organic matter in the soil.  
Farmers traditionally have used organic fertilizers which replenishes the soil with humus, the vital ingredient needed to make minerals locked deep in the soil available. As farmers have moved towards more intensive methods of farming, inorganic, petroleum-based, fertilizers are used, like Nitrogen, Potassium and Phosphorus. These deplete the soils of humus and thus decrease overall fertility long term.
2. Depletion of minerals due to over-fertilising of Nitrogen Phosphorus and Potassium.  
Soil needs time to reconstitute itself, and new food production techniques with emphasis on output give it no time to recover its health. There is no provision to make up for the wide range depleted minerals in the soil as a result of intensive crop production. Only Nitrogen, Phosphorus and Potassium chemical fertilizers are used to replenish soils. These fertilizers are highly acidic and disrupt the pH (acid/alkaline) balance of the soil making other minerals unavailable to the plant and so the plant grows deficient in vital trace minerals like zinc, iron, magnesium and copper.
3. Desire for Better-looking Food.  
In 1997, Organics Centre published a report titled "Still No Free Lunch: Nutrient levels in U.S. food supply eroded by pursuit of high yields". The report found clear evidence that as the produce we eat gets larger in size, its vitamins, minerals and beneficial chemical compounds diminish, as do taste and aroma. The additional undesirable trade-off of bigger apples and golden ears of corn is the lower nutritional value of the entire produce.
4. Preferences for Exotic varieties.  
People are turning to more exotic varieties and out-of-season imports such as courgettes, corn on the cob, and frozen exotic vegetables, such as mange-tout and bean-

sprouts. There are many reasons to believe that locally grown food (foods produced within 100 miles of your homes) might be better for you than produce purchased in the supermarket. Being in transit or cold-stored for days affects not only the taste of your food, but also the nutritional value of the food declines.

5. Reliance on Convenience Foods.

Diet patterns of families are changing and refined foods are consumed in such amounts that intake of minerals and vitamin-rich foods is far lower than it should be. The magnesium content of refined foods is usually very low. Deficiencies in Magnesium and other essential minerals are commonly seen in those who eat a diet high in processed-foods and those who cook or boil all their foods, especially their vegetables. Refining and processing of grains and other foodstuffs typically results in a loss of 70% or more of the natural magnesium content of the food, as well as other vital nutrients. The conversion of wheat into flour results in a loss of 82% of magnesium. Refining rice into polished rice sacrifices 83% of its magnesium.

Why should we care?

As early as the 1930's, scientists warned that declining nutrient levels of our food would lead to a rise in chronic degenerative diseases like heart disease, cancer and adult-onset diabetes. In 1996, the Uniform Data Standards Committee (UDSC) released a study that correlated a decrease in minerals in food to health issues prevalent today. (See Table 3)

Life Clinic Says:

Hong Kong imports nearly all its foods, some of which are shipped from a long distance taking many hours to get here. Very little studies have been demonstrated on the effects of the produce imported, however taking into account the previous studies cited above it appears we could be more deficient in nutrients than first thought.

Here's what we can do:

1. Choose organic food.  
Organic farmers let soil reconstitute itself before planting and use organic manures so there is a possibility that the soil they use has the right chemical composition, hence their produce is likely to be more nutritious.
2. Eat Locally-grown food  
Eating food grown locally in Hong Kong ensures that they are as fresh as possible, and less likely to be depleted of nutrients from long transit times. When looking for choices we recommend homegrownfoods – website [www.homegrownfoods.com.hk](http://www.homegrownfoods.com.hk)
3. Take vitamin and mineral supplements.  
The bioavailability of nutrients in supplements is 80-100% if the right supplements are selected. Compared to foods, which is unpredictable, this is an assured way to cover any potential deficiencies and provide our basic requirements. Choose a supplement that is pharmaceutical-grade, and potency and purity tested by independent third parties. Using personalised supplementation, can help reduce the risk of chronic, degenerative diseases further.

The root cause of cancer was discovered in 1890 by William Russell (1852-1940). The brilliant Dr. Russell saw microbes both inside and outside of the cancer cells. It was obvious that the microbes inside the cancer cells were the ones causing cancer.

The cancer microbe was studied in detail in the early 1900s and was found to be highly pleomorphic. Many years later another microbiologist, Gaston Naessens, counted 16 different sizes and shapes of the cancer microbe (see *The Persecution and Trial of Gaston Naessens* by Christopher Bird). The medical establishment in

Canada was so delighted with his discovery that they had him thrown in jail.

You see, if cancer is caused by microbes that are inside the cancer cells, then it is easy to cure cancer; just kill the microbes inside the cancer cells. But no medical establishment wants people to know that cancer can be cured. They want cancer to be a mysterious disease that will never be cured.

The size and shape of the microbe is a function of the pH inside the cancer cell. The higher the pH, the smaller the microbe.

The higher the pH the more lethargic the cancer microbes become and cancer spreads more slowly. Natural medicine practitioners take advantage of this fact and frequently use highly alkaline protocols to slow down the spread of cancer and in many cases these treatments can cure cancer.

Also, Dr. Royal Rife, a microbiologist, in the 1930s, also knew that it was microbes which were inside the cancer cells which caused cancer. By knowing this he developed a gentle electromedicine device to kill these microbes. This device had a 100 percent cure rate and it did nothing but kill microbes inside the cancer cells.

The AMA and FDA (Food and Drug Administration) were so incensed that he was curing cancer that the AMA tried to buy him out. When he refused the FDA came in and destroyed his lab and his machines which had not already been sold and delivered.

Researchers since then have found three of his original machines, which had been sold before the FDA destroyed his lab. They have made the specifications of his equipment public information.

□ [RifeVideos.com](http://RifeVideos.com)

Dr. Virginia Livingston's team of cancer researchers discovered why cancer cells have DNA damage. They discovered that the microbes inside the cancer cells get inside the cell nucleus and

their DNA mixes with the DNA of the cell, which changes the DNA of the cancer cells.

In fact, the concept that the DNA of a microbe, which gets inside of a human cell nucleus, and thus changes the DNA of the human cell, is at the heart of gene therapy. This is not some strange theory, it is a concept which is used in modern medicine to treat genetic diseases.

My point is that the Livingston team discovered that the DNA damage occurs after the cell is already cancerous (i.e. after the microbes are already inside the cancer cells).

Dr. Livingston designed a vaccine to kill these microbes and obviously died without any recognition from orthodox medicine for her team's critical discovery. Instead, orthodox medicine has ignored her team's discovery and still claims that it is DNA damage that causes cancer. This gives them an excuse to claim that a cure for cancer is 50 years away. A cure for cancer will always be 50 years away according to anyone who is in bed with the pharmaceutical industry, such as the American Cancer Society.

By claiming that DNA damage causes cancer, the public believes that cancer will never be cured. But Virginia Livingston was curing cancer with a vaccine she developed.

This DNA damage (which is a result of cancer, not a cause of cancer), is what all large “cancer research” organizations claim cause cancer. They are spending billions of dollars trying to fix this DNA damage instead of trying to safely target and kill the cancer cells using Mother Nature (who already knows how to target and kill cancer cells) or by killing the microbes inside the cancer cells (which reverts the cancer cells into normal cells), which is how Dr. Rife cured cancer.

The second concept I wish to discuss is regarding the nature of cancer cells. A Nobel Prize was awarded in 1931 for the discovery that the defining characteristic of cancer cells is low ATP energy.

ATP is a molecule which is made inside the mitochondria, which is inside of all cells. There are thousands of mitochondria inside of all cells and the ATP is what provides cells their energy.

So why do cancer cells have low ATP energy and who cares if there are microbes inside the cancer cells?

In 2004, an ICRF cancer researcher tied these two major discoveries together by explaining the mechanism of how these microbes, which are inside of the cancer cells, block the production of ATP molecules. In other words, he explained that cancer is caused because the microbes inside the cancer cells block the production of ATP in two different ways.

It is beyond the scope of this article to explain this mechanism, and its ramifications, but if you are interested: [What Causes Cancer](#).

This discovery supported the claim of Dr. Rife that if you kill these microbes the cancer cells will revert into normal cells. They become normal cells again (or for the first time in many cases) because with no microbes inside the cell the ATP energy will be restored and the cell will be healthy again.

This discovery has led to several new, highly effective natural cancer treatments, particularly [DMSO](#), [MSM](#), and honey protocols. The DMSO, MSM, and honey are “Trojan Horses” to get microbe-killing substances inside of cancer cells to kill the microbes.

This discovery has also explained how some previously existing natural cancer treatments worked.

The discovery also led to the fact that some natural cancer treatments would conflict with each other (the conflict is not dangerous, but one treatment may neutralize another treatment). The conflict can occur because one type of cancer treatment is trying to lower ATP energy (to cause the cancer cells to fall apart),

and another treatment is trying to kill the microbes inside the cancer cells, which would raise ATP energy because when the microbes are gone, so is the reason ATP energy in cancer cells stays low.

For example, do not mix Paw Paw (which causes cancer cells to fall apart by lowering ATP energy) with the High RF Frequency Protocol, which was designed to kill the microbes inside the cancer cells and thus revert the cancer cells into normal cells. When you kill the microbes the ATP energy rises because there is nothing to block the creation of ATP energy (the microbes are what block the ATP energy).

Thus, one protocol is lowering the ATP energy and the other protocol is incidentally raising the ATP energy. The Paw Paw treatment will be worthless. The High RF Frequency Protocol will work just fine because it is interested in microbes; it is not directly interested in ATP energy.

A different ICRF cancer researcher designed the protocol for using the High RF Frequency Protocol for cancer. It is one thing to have the equipment and another thing to know how to use it.

Let us partially summarize what the cancer microbe does.

First, the cancer microbe largely or totally blocks the production of ATP molecules in the mitochondria (and the cancer cells have to revert to another method, fermentation, to make enough ATP molecules to stay alive).

Second, the DNA of the cancer microbes is what causes the DNA damage of the cancer cells after the cell is already cancerous or is beginning to become cancerous.

Third, the cancer microbe also excretes enzymes that coat the outside of the cancer cells so the immune system cannot identify them as cancer cells and thus the immune system cannot safely

target and kill them. The existence of the enzyme coating has been known about for more than 50 years in natural medicine.

In fact, over 50 years ago there were natural cancer treatments (e.g. proteolytic enzymes) that stripped away these enzyme coatings so the immune system could identify the cancer cells and kill them. Dr. Kelley used proteolytic enzymes as part of his treatment.

The existence of this protein coating is proof that DNA damage is not the cause of cancer. How could DNA damage create a coating of enzymes on the surface of cancer cells??

Fourth, Dr. Mathias Rath, MD, who had to flee the United States to avoid being arrested for curing cancer, discovered that these enzymes (or different enzymes excreted by these microbes, we don't know) also cut a path across tissue so the cancer cells could spread more easily.

It is beyond the scope of this article to go any further, but my point is that there has been researcher after researcher who knew about the cancer microbes inside the cancer cells. And there have been a growing number of clever tactics developed to kill these microbes.

When you kill all of the microbes inside of a cancer cell, the cancer cell will revert into a normal cell because there is nothing to block the production of ATP energy. This is the ideal way to cure cancer because there are no dead cells and no debris from dead cells.

But most natural cancer treatments work in other ways.

Some treatments use natural substances that target and kill cancer cells. Laetrile, or Vitamin B17, is a perfect example. Carrots and purple grapes both contain multiple nutrients that can target and kill cancer cells. One researcher thinks that it is the oxalic acid in carrots that cures cancer. He may be right.

Other treatments work by supercharging the immune system and then letting the immune system deal with cancer. One example is Dr. Bob Beck, who had a Ph.D. in physics. He designed a cancer treatment that removed all microbes from the bloodstream and found out that by doing this the immune system was supercharged and the immune system could get rid of the cancer cells.

The problem with building the immune system is that it is a slow process. Many cancer patients today who seek out natural cancer treatments have been sent home to die and do not have the time left to live to have their immune system rebuilt after it had been damaged by chemotherapy. But even these patients can benefit from the Bob Beck Protocol, but it should not be their primary protocol.

While the High RF Frequency Protocol works by killing microbes, primarily inside the organs, which gets the immune system functioning again, it also provides key nutrients to the cells, such as in the immune system, the High RF devices directly energize cells to keep the patient alive, the devices also pump the lymph system, etc.

Some treatments work by using super-nutrients to “keep the patient alive” (so they have more time to treat their cancer) by using special cell-energizing supplements. The Budwig Diet is a good example. The GB 4000, an electromedicine device, is the best way to energize cells quickly (see the “Weak Cancer Patients” article and the “Understanding Treating Cancer” article).

In fact, the best natural medicine treatments today use a combination of tactics. One highly nutritional protocol “keeps the patient alive” and at the same time other treatments are dealing with the cancer cells and yet other treatments are building the immune system, others are killing microbes in different places, etc.

The three most powerful treatments on this website, the High RF Frequency Protocol, Collect-Budwig Protocol, and Cesium

Chloride Protocol are all multi-pronged approaches, and all come with expert support.

- Combining the Collect-Budwig with the Dirt Cheap Protocol

These two protocols were combined because we were getting some extremely advanced cancer patients. Using similar logic, the Dirt Cheap Protocol (usually without the Kelmun protocol due to too much alkalinity) can be combined with any other protocol.

Remember that many other treatments can be combined with these treatments. For example, either High RF Frequency Protocol can be combined with any of the other protocols.

Some newer protocols use the technology of killing the microbes inside the cancer cells, such as the High RF Frequency Protocol, the DMSO protocols, and honey protocols. Most of the DMSO protocols are on the website of the Independent Cancer Research Foundation. I support the DMSO protocols because I have been researching DMSO since 2004.

In theory, DMSO could cure cancer in one day, as it does not stress the stomach because it can be taken transdermally (i.e. through the skin). However, we are concerned about Herxheimer's (which is severe brain fog caused by the release of mycotoxins by dead microbes) so we have not tried to cure cancer in one day with this protocol.

However, "brain fog" is not dangerous and a patient who understands what causes brain fog, and can mentally prepare for it, could use very high doses of DMSO and chlorine dioxide (DMSO/CD).

In fact, I probably had the worst case of brain fog in history because I accidentally overdosed on a super-microbe-killing substance used in water treatment plants. It felt like most of my brain was dead. But I knew exactly what was going on in my brain

so I just slept it off. So if the patient is old enough to know what to expect, they can be prepared for it.

The MSM protocols were designed to do this also and we hoped they would be as effective as the DMSO protocols (because the MSM molecule is almost identical to the DMSO molecule and MSM does not cause the body odor of DMSO), but so far the DMSO protocols seem to be significantly more effective. However, MSM is used to help clean lactic acid out of the blood and do other things, so it has its own benefits.

My point is that it is common to combine multiple approaches in the same treatment. That is what the experts work on accomplishing.

This is just an introduction to modern natural medicine treatments. [Understanding Treating Cancer](#) goes into more issues. You might also want to read [What Causes Cancer](#), which goes into detail about what is going on inside the cancer cell.

You would not believe how many emails we have gotten from cancer patients who have gone through these three steps:

- The patient had chemotherapy, radiation, and surgery to treat their cancer;
- The patient was told they were “cancer-free”;
- Months later cancer “came back,” which is called “regression.”

Among other things, this article will explain what went wrong and how to prevent cancer from coming back. When talking about what causes cancer we need to talk about it at two different levels.

The first level is talking about cancer at the systemic level, meaning what conditions in the body allowed cancer to grow out of control and how do we deal with this issue.

The second level of talking about cancer is talking about what causes cancer at the cellular level. In other words, why does a healthy cell become cancerous?

As part of this, we will also discuss how to revert cancer cells into normal cells, which is one way to treat cancer. For example, the Dirt Cheap Protocol has more than a dozen treatments that revert cancer cells into normal cells.

These two subjects are totally different!

We can compare these two levels by talking about a flood. We could talk all day long about the damage a rain storm caused, such as the flooding of rivers, the damage to crops caused by heavy rain, the damage to roads that have flooded, etc. But that is only one level to talk about. We could also ask what weather conditions caused rain to form in the clouds. Thus, a scientist might talk about what causes rain up in the clouds, but a newscaster might talk about the damage caused by the flooding of a river caused by the rain.

But that is only one level to talk about. We could also ask what weather conditions caused rain to form in the clouds. Thus, a scientist might talk about what causes rain up in the clouds, but a newscaster might talk about the damage caused by the flooding of a river caused by the rain.

The same is true about cancer. A cancer practitioner might research how to kill cancer cells or revert them into normal cells, but a cancer researcher might ask why the immune system was weak and why individual cells were cancerous.

A discussion about what causes cancer at the cellular level is a totally different subject than talking about what causes cancer at the systemic level.

Fixing the root cause of cancer

While many natural cancer treatments do very well against cancer, what is missing in many natural cancer treatment protocols is getting rid of the microbes in the organs, which is the root cause of most cancer.

In many cases, the immune system can get rid of these microbes, but in fact, some types of tapeworms, flukes, and fungus, etc. cannot be killed by the immune system for one reason or another (e.g. the microbes are not accessible by the immune system).

Liver flushes and special nutrients may be required to deal with these microbes and parasites. But the fact is that many natural cancer treatments do very well without dealing with these special microbes. But the patient should be aware of these issues.

By getting rid of the microbes in the organs, plus doing the normal cancer treatments, the balance (i.e. a strong immune system and a low number of cancer cells) is restored enough to keep cancer from coming back. The patient is cured because their immune system has been fixed and the number of cancer cells (by using special protocols) has been reduced. Cancer will not come back as long as the patient watches their diet.

The approach of orthodox medicine, however, is to severely damage the immune system with chemotherapy, radiation, and surgery. This makes the imbalance even worse because these things damage the immune system and do a very poor job of targeting the cancer cells and do an even worse job of killing the microbes in the organs.

Orthodox cancer treatments also kill many healthy cells and can damage organs, the lymph system, etc. Is it any wonder cancer always seems to “come back” after surgery or chemotherapy? This is called “regression.”

For example, how does cutting off a breast going to fix the immune system? Don't be absurd. I don't know how many times I have told cancer patients that “you cannot cut cancer out.”

Is it any wonder that alternative cancer treatments, when administered by experts, have a massively higher cure rate than orthodox medicine? Most natural cancer treatments include immune builders and things that kill cancer cells. Some protocols also include things to clean the blood of microbes, which also will supercharge the immune system.

Ponder this carefully: Even when orthodox medicine puts someone into “remission” (i.e. their cancer appears to be gone), they have not fixed the root cause of cancer, so it is almost certain cancer will come back.

Because the root cause of cancer is a weak immune system, you cannot cut cancer out. You have to deal with the root cause of cancer.

“A discussion about what causes cancer at the cellular level is a totally different subject than talking about what causes cancer at the systemic level.”

Webster Kehr

The Cancer Tutor

Cancer on the systemic level

Everyone has cancer cells in their body, so why does one person never get diagnosed with cancer and another person is diagnosed with cancer? Cancer is almost always caused by the same multi-step sequence of events.

First, nasty microbes and parasites get inside of the organs and make their homes there. These microbes generally come from meat that was not adequately cooked, but they can come from other sources.

Second, these microbes intercept glucose which was headed for the cells in the organs.

Third, these microbes excrete (as waste products) mycotoxins, which are highly acid and totally worthless to the cells.

Fourth, because the cells (in the organs) don't get the food they need (because it has been intercepted), and because they are living in a sea of filth (i.e. mycotoxins), the cells in the organ become weak.

Fifth, organs are made exclusively of cells. In other words, if you took all of the cells out of an organ, there would be no organ. Thus, because the cells in the organ(s) are weak, the organ(s) are weak.

Sixth, because one or more major organs are weak the immune system becomes weak. Actually, the microbes weaken the immune system both directly and indirectly.

Seventh, because the immune system is weak it cannot kill enough cancer cells and the cancer cells grow out of control.

Thus, in summary, the root cause of cancer is microbes and parasites that are in the organs or colon (or bloodstream), which weakens the immune system.

However, other things can cause cancer. For example, a vaccination can weaken the immune system due to mercury and / or toxins. Filth in the colon can also lead to a weak immune system (see the book: *Fire in the Belly* by Dr. Keith Scott-Mumby)

The reader might have noted the “or bloodstream” above. Cancer patients who have microbes in the organs also have microbes in the bloodstream. Which caused the other will vary by the cancer patient. But microbes that originate in the organs will spread microbes to the bloodstream, and vice versa. Exactly how much the microbes in the organs weaken the immune system, versus

how much the microbes in the bloodstream weaken the immune system varies by case, but parasites likely would be found in the organs.

When thinking about the above steps, there are three major ways to cure cancer:

- Safely target and kill the cancer cells;
- Kill the microbes inside the cancer cells (which will be discussed below) and the cancer cells will revert into normal cells;
- Kill the microbes that are causing the immune system to be weak (and this includes the microbes in the organs and the microbes in the bloodstream).

Actually, without doing No. 3, cancer could come back again.

The reader might wonder if there are any natural cancer treatments that are specifically designed to identify and get rid of the microbes in the organs? The answer is yes.

For example, the High RF Frequency Generator with Plasma Amplifier or High RF Frequency Generator with Linear Amplifier will kill these microbes and parasites without knowing what they are. This is because this device will cover enough frequencies to kill all of these microbes and parasites.

Another option is “liver flushes,” such as designed by Hulda Clark or Ty Bollinger (in his book *The 31-Day Home Cancer Cure*).

So in short, there are treatments for all budgets.

The definition of cancer cells

So what causes an individual cell to become cancerous? Many cancer cells form by a prior cancer cell dividing and creating two cancer cells. But how does a normal cell, which is not cancerous, become cancerous?

In a normal cell, molecules called ATP (adenosine triphosphate) provide the energy of the cell. ATP molecules are created inside the mitochondria which are inside of every human cell. In fact, there are thousands of mitochondria inside of every human cell.

The very definition of cancer cells is low ATP energy.

The normal process of creating ATP molecules is this (highly simplified):

- Glucose gets inside of the cell from the bloodstream;
- Some of the glucose is converted into pyruvate (this is a multi-step process);
- Pyruvate gets inside of the mitochondria;
- Once inside the mitochondria, pyruvate is at the beginning of two sequential chemical reactions (the Citric Acid Cycle or Krebs Cycle and then the Electron Transport Chain which spins off about half-way through the Citric Acid Cycle). It is these two cycles which create most of the ATP molecules in the cell.

Cancer cells consume 15 times more glucose than a normal cell. Thus, a person would logically expect a cancer cell to create 15 times more ATP molecules than a normal cell.

But in reality, cancer cells create a very small number of ATP molecules. Cancer cells are ATP molecule-starved and they have to revert to fermentation to create what little ATP molecules they create.

With so much glucose there should be an abundance of ATP molecules. Why do cancer cells consume 15 times more glucose and yet not be able to create a significant amount of ATP molecules?

The thing that blocks the production of ATP molecules is a very special pleomorphic bacteria that is inside the cancer cells.

The Independent Cancer Research Foundation and others believe the microbe is *Helicobacter Pylori* or *H. pylori*. In some cases, *Fusobacterium* may be involved as well as it is also known to get inside of cells.

While everyone has *H. pylori* bacteria in their body (generally in their digestive tract), how do *H. pylori* get inside of a healthy cell? Generally, it doesn't. But in some cases, an acidic diet can make this bacteria highly aggressive and it can literally drill itself inside of a normal cell to get away from the acidity in the blood, as discovered by Robert O. Young, Ph.D.

Another way microbes can get inside of cells is because asbestos or the chemicals in tobacco cut the cell membrane. This can allow microbes inside the cells. But remember that even though all of us have cancer cells, don't forget we also have an immune system.

So how does a bacteria block the production of ATP molecules and thus turn a cell cancerous after it has gotten inside the cell?

In 2004, the Independent Cancer Research Foundation developed the model which still stands today.

The bacteria blocks ATP production in two different ways:

First, bacteria eat glucose so as the bacteria proliferate inside the cell (by the way, a bacteria is roughly the same size as mitochondria) they intercept more and more glucose. This means less and less pyruvate is made because there is less glucose to be converted into pyruvate. This means less ATP is made.

Second, microbes excrete mycotoxins, which are highly acidic and totally worthless molecules.

As one ICRF researcher put it: The mitochondria, instead of “swimming” in a sea of pyruvate are swimming in a sea of mycotoxins.

Both items contribute to the mitochondria not obtaining enough pyruvate and this hinders both the Citric Acid Cycle and the Electron Transport Chain and thus blocks the production of an adequate amount of ATP in the mitochondria.

This microbe is highly pleomorphic, meaning it has many different sizes and shapes. This microbe can literally be smaller than a virus. Many people think it is a virus or fungus that causes cancer, but it is actually a cell wall deficient highly pleomorphic bacteria.

The book *The Persecution and Trial of Gaston Naessens* describes the 16 phases of the cancer microbe. See this article for their names: Advanced Cancer Theory.

In one of its smaller states, it is the size of a virus and can enter inside of the cell nucleus. Like a virus, which gets inside of the nucleus, the DNA of the cancer microbe can interact with the DNA inside the cell nucleus and change the DNA structure of the cell.

- More importantly, the Dillers [who were part of the Dr. Virginia Livingston team] showed that cancer germs [i.e. microbes] were able to gain entrance not only into the [non-cancerous] cell (intra-cellular), but also into the nucleus of the cell. This intra-nuclear invasion meant that cancer microbes could gain access to the genes contained within the nucleus itself. — *Four Women Against Cancer*, by Dr. Alan Cantwell, page 47

Scientists see the DNA damage caused by these microbes and claim that it is DNA damage which causes cancer. This is like saying that smoke is the cause of fires. It is a good guess, but it is false. The DNA damage of a cancer cell is caused by the DNA of the same highly pleomorphic bacteria that blocks the production of ATP molecules. Actually, this bacteria does many other things to create cancer cells, protect cancer cells from the immune system and spread cancer. In fact, the characteristics of this bacteria are mind-numbing.

Thus, the claim by cancer researchers (who are funded by the pharmaceutical industry) that DNA damage causes cancer is wrong. Whether this is an intentional error (i.e. to avoid finding a cure for cancer) or is caused by ignorance I do not know.

In any case, due to the lack of energy in cancer cells (i.e. due to the lack of ATP molecules), cancer cells are very weak, which is the definition of a cancer cell. But because cancer cells steal glucose from the body the non-cancerous cells have less glucose and are very sick. They are sick for other reasons as well (e.g. cachexia cycle as cancer cells excrete lactic acid).

Many cancer researchers, starting over 100 years ago in the 1890s, have isolated the cause of cancer to be microbes (at the cellular level), though they did not understand the mechanism inside the cell which caused a microbe to make a cell cancerous.

- In 1890 the distinguished pathologist William Russell (1852-1940) first reported “cancer parasites” in cancer tissue that was specially stained with carbol fuchsin, a red dye. The “parasite” was found inside and outside the cells. The smallest forms were barely visible microscopically, and the largest parasites were as large as red blood cells. Russell also found “parasites” in tuberculosis, syphilis and skin ulcers. — *Four Women Against Cancer*, by Dr. Alan Cantwell, pages 53-54

Dr. Russell, in 1890, knew that the cancer microbes were pleomorphic.

Note that the cancer microbe was found both inside and outside of the cancer cells. One method that cancer cells use to spread quickly (at least for some kinds of cancer) is for the cancer microbe to come out of the cell, travel through the blood and create a new “colony” of cancer cells far from the original colony. Squamous Cell Carcinoma, melanomas, sarcomas and uterine cancer have all been identified by ICRF researchers as spreading in this way.

This is just the beginning.

The cancer microbe also excretes enzymes that coat the outside of the cancer cells. This coating of enzymes blocks the immune system from identifying the cancer cells as being cancer cells.

It was also discovered, around the 1950s, that natural pancreatic enzymes, made in the pancreas, could dissolve this protein coating so the immune system could identify and thus kill the cancer cells.

This discovery, in turn, led to the advice that natural cancer treatments should prohibit the cancer patient from eating meats or other foods that the pancreatic enzymes cut apart. In other words, these foods “use up” the pancreatic enzymes while in the stomach so less of them are available to expose cancer cells to the immune system.

When a cancer patient is using pancreatic enzymes in their protocol, they should not eat meat or dairy products. In fact, no cancer patient should eat very much meat and they should not eat or drink any dairy products (for multiple reasons) or sugar.

The trade off is that meat can help a weak cancer patient who is not on a pancreatic enzyme protocol so in some cases meat is fine for a cancer patient.

Dr. Matthias Rath discovered that these microbes excrete enzymes that cut a path along tissue so cancer can spread more easily along the tissue. The cancer microbes are a cancer-causing machine.

In summary, cancer at the systemic level is caused by an imbalance between the strength of the immune system and the number of cancer cells. At the systemic level many, many things can cause cancer, especially things that weaken the immune system. The weak immune system is almost always caused by microbes and parasites which are inside the organs but are not necessarily inside the cancer cells.

But cancer at the cellular level is caused by very unique and common microbes which are inside of the cancer cells. These microbes do many amazing things to help cancer cells do their damage and protect themselves.

Cancer cells create and excrete large amounts of lactic acid, as already mentioned, as they process large amounts of glucose inefficiently. This lactic acid goes into the bloodstream and gets to the liver. The liver converts the lactic acid to glucose. This “ping pong ball” cycle, where the cancer cells convert glucose into lactic acid and the liver converts lactic acid into glucose, is called the lactic acid cycle or cachexia cycle.

This cycle is what kills about half of all cancer patients because so much energy is consumed at both ends of the cycle. The patient becomes weak and simply dies.

The lactic acid also blocks many key nutrients from getting to the cancer cells.

Dealing with the lactic-acid cycle is frequently a major effort of a cancer treatment. It may involve using hydrazine sulfate, Methyl-Sulphonal-Methane (which helps flush out the lactic acid), D-Ribose (to get the energy to the non-cancerous cells), Vitamin C (ditto), etc. etc.

Here is an article which shows the 16 different names of the different sizes of the cancer microbe (the images are not to scale or shape): [Advanced Cancer Theory](#)

Cancer is not caused by DNA damage

Microbes can lower ATP energy, which is the very definition of a cancer cell. Are there other things that can lower ATP energy? In theory, there are, but from a statistical standpoint, any other cause would be almost statistically impossible.

One possibility is DNA damage where the DNA damage causes defective proteins and the defective proteins cause a loss of some ATP energy.

As I will point out, it is doubtful that more than a few thousand cancer patients worldwide, if any, have cancer caused by DNA damage.

But it is almost certain that certain chemicals, especially asbestos, can cause cancer. It is almost certain that asbestos causes cancer by cutting the sides of cells, thus allowing bacteria to get inside the cancer cells more readily. And it is then the bacteria that causes cancer as we have already seen.

Let's talk more about the possibility of DNA damage causing cancer.

Orthodox medicine claims that all cancer is caused by DNA damage. This is nonsense. However, in theory in rare cases, DNA damage may cause cancer.

Let's talk about the famous BRCA2 gene as an example. Can a defect in this gene cause cancer? It is not clear whether the BRCA2 gene is a cause of cancer or that the microbes inside the cancer cells cause the BRCA2 gene damage. Orthodox medicine would never examine this issue because they are looking to sell drugs, not save lives.

A DNA strand is between 3.2 billion and 3.5 billion nucleotides long. Only a very small percentage of this DNA codes for proteins, about 3 percent. And only a very small percentage of these proteins are involved in the creation of ATP energy. The proteins we are interested in are the proteins needed for the conversion of glucose to pyruvate, for example.

In other words, we are only interested in the structures inside the cells which are involved in the conversion of glucose to pyruvate.

It is possible, but highly unlikely, that DNA damage could affect one of the proteins needed for the creation of ATP energy.

As the cell with this DNA damage divides, all of the “daughter” cells” will have this same genetic damage.

So how does a bad gene create a cancer cell? In a cell, genes are the patterns used to make enzymes or proteins. If a gene is damaged then the enzymes or proteins made by this gene will be defective.

Everything that goes on in a cell is controlled by proteins. There are worker proteins, supervisor proteins, etc. If these are damaged then one or more of a large number of chemical chain reactions inside the cell may fail. This may mean the creation of ATP is damaged.

If a significant amount of ATP energy production is blocked inside the cell, then by definition the cell is cancerous.

So how exactly could the BRCA1 or BRCA2 defective genes cause cancer? The truth is that no one really knows whether these defective genes cause cancer at all. In order for these defects to cause cancer, they must create defective proteins that are needed for the conversion of glucose to pyruvate.

A genetic defect may have absolutely nothing to do with the creation of pyruvate. In other words, genetic defects may be a symptom of cancer, meaning this damage may be caused by the DNA of the microbes which are actually causing cancer.

These defects cannot block the ATP production completely or the cell would fall apart. So we do know it must be a partial interference if at all.

For now, we will have to say, “We don't know if the defective genes are a cause of cancer or a symptom of the presence of the microbes that cause cancer.”

## Focusing on microbes inside cancer cells

Let's ask one more question: Have there been any cancer treatments that cured cancer by killing the microbes inside the cancer cells?

In the 1930s Dr. Royal Rife, a microbiologist, was able to cure cancer with gentle electromedicine, which had two frequencies. One frequency was designed to kill the cancer bacteria and the second frequency was a “carrier” frequency which got the other frequency through the cell membrane (and actually through the entire body) to get inside the cancer cells to kill the microbes.

Dr. Rife had a 100 percent cure rate of cancer patients, but he was shut down by the FDA after refusing to sell his technology to the American Medical Association, which he knew would bury his technology.

Two modern-day Rife machines have replicated both of the types of machines that Rife built. These are the High RF Frequency Generator family of gentle electromedicine devices.

The Independent Cancer Research Foundation researches both electromedicine protocols (such as Rife developed) and has also designed several cancer treatments using: DMSO, MSM, honey, maple syrup or molasses as carriers (i.e. Trojan Horses) to get microbe-killing substances inside of cancer cells. These treatments have been very successful.

In other words, if you kill the microbes inside the cancer cells, the cancer cells will revert into normal cells.

In the book *Cancer & Natural Medicine — A Textbook of Basic Science and Clinical Research*, author John Boik identifies a dozen substances which have been shown in vitro to be able to revert cancer cells into normal cells (he calls it “differentiation”). All twelve of these items are anti-microbial. So it is a matter of getting these substances inside the cancer cells.

In the Boik book, DMSO is used to get these microbe-killing substances inside the cancer cells. DMSO is so important it is mentioned in its own table, Table 2.3.

In Atlanta, Georgia, a medical doctor was curing cancer patients using DMSO and very low dose chemotherapy (about 10 percent of a normal dose). Why was such a low dose so successful? Because the DMSO allowed the chemotherapy to target the cancer cells and avoid damaging healthy cells. This doctor was shut down by the FDA. Using DMSO in a cancer clinic in the United States is a magnet to get the FDA to raid the clinic.

This website calls his treatment DPT (DMSO Potentiation Therapy). As far as we know, the ICRF, Boik, and the medical doctor all made their discoveries independently.

This is precisely why the ICRF recommends a cancer patient take MSM before they use chemotherapy (not that we endorse chemotherapy). Some of the MSM converts into DMSO, once inside the body, and the DMSO may help some of the chemotherapy target the cancer cells.

Some clinics use the combination of insulin and chemotherapy. This treatment also uses low-dose chemotherapy, but it is combined with insulin, which to some degree also targets cancer cells. This is called IPT or Insulin Potentiation Therapy.

Vitamin C, which also kills microbes, is also used as an IV for cancer patients. The ICRF has tried to get these practitioners to add DMSO to their protocol to open up the ports of the cancer cells, but practitioners rarely listen to researchers.

There are likely many natural molecules which cure cancer by killing the microbes inside the cancer cells, but which have not yet been identified as working in this manner. Vitamin C and Vitamin D3 are good examples. These are highly anti-microbial vitamins which cannot possibly kill cancer cells, so the only way they can

treat cancer is by killing the microbes inside the cancer cells (in the case of Vitamin C, hydrogen peroxide is also made).

Of course, we combine MSM with Vitamin C or Vitamin D3.

The number one plant or herb in the world, which has been identified as successfully killing H. pylori is turmeric. Turmeric is also one of the top herbal treatments for cancer. This website combines turmeric (or curcumin, which is more powerful) with honey. Ginger is also used with honey. Both of these combinations are known to have cured cancer by themselves. And we combine honey with cinnamon.

It is much easier to kill microbes than to kill cancer cells if the substance can get inside of the cancer cells. DMSO, MSM, and honey are all “Trojan Horses” to get microbe-killing substances inside of cancer cells. Maple syrup or molasses is commonly used with baking soda and has been very successful. I have received several testimonials from people using this combination (i.e. the Kelmun protocol) to treat cancer or shrink tumors.

For several years, the ICRF has been involved in researching ways to revert cancer cells into normal cells by killing the microbes inside the cancer cells. The reason for this research is that these protocols can work much faster than protocols which kill cancer cells because there is no debris from dead cancer cells. This is the ideal way to cure cancer. On the other hand, building the immune system is a slower process, but is a very good method.

Ultraviolet light has also been researched over the years and the ICRF is researching the use of this protocol. There is a UV light protocol mentioned in the “Inexpensive Cancer Treatments” article. This protocol has created harmless Herxheimers so we know it does kill microbes in the bloodstream.

This protocol, if used properly, kills microbes in the bloodstream. This is an immune-building process, so it is slow working, but

getting rid of the microbes in the bloodstream is a cancer treatment because it does build the immune system.

But no matter what a cancer patient does, there should be something in the protocol to deal with the microbes inside the organs so that the immune system can be function properly. Otherwise, cancer may come back.

Dr. Bob Beck's contribution

A normal person will not be diagnosed with cancer in their lifetime. The reason is that there is enough of a balance between the power of their immune system and the number of cancer cells such that the cancer cells do not get out of control.

However, what most people do not understand is how sophisticated and potent the immune system is if it is fully functioning. In fact, it is extremely rare (if it has ever happened) when someone's immune system is fully functioning, which is why so little is known about the power of the immune system.

Natural medicine researchers can supercharge the immune system beyond imagination. But orthodox medicine researchers never work with natural medicine researchers, but orthodox medicine researchers control 99.999 percent of the research money. So while much is known about how to supercharge the immune system (natural medicine), little is known about what the immune system looks like when it is supercharged (orthodox medicine).

For example, what is the set of neuropeptides when the immune system is fully functioning? No one knows.

It is a fact that if a person's immune system was fully functional no one would ever get cancer. This would be a scenario that orthodox medicine never wants to see.

What is known is that the immune system creates two key anti-cancer molecules called: interleukin and interferon. These

molecules are called neuropeptides or nerve proteins. There are more than 2,000 different types of neuropeptides in the body, but the cancer-fighting effects of most of them are unknown. In fact, no one knows how many different types of neuropeptides could be created by the body.

Interleukin and interferon, and likely several other neuropeptides are absolutely deadly to cancer cells.

The problem is that the human body generally does not produce an optimal amount of these neuropeptides. In fact, the body only creates a very small number of these neuropeptides.

The reason is microbes, but not the same microbes that live inside of cancer cells, it is the microbes that live outside of the cancer cells.

The average person has about 2 pounds of microbes in their bloodstream and in other places in their body. It is these microbes which interfere with the immune system's ability to create these key neuropeptides.

How do we know this?

The reason is the Bob Beck Protocol. This protocol is a simple electromedicine device which completely cleans the blood of microbes within a few months. It originally was designed as a cure for AIDS, which it is, but it also turns out to be a cure for cancer in many situations (but not for very advanced cancer cases because it can take too long to become effective).

The question is this: How does this simple protocol cure cancer?

The reason is that when the body has no microbes in the bloodstream the immune system becomes supercharged as it can in no other way. The body makes the neuropeptides in “large” amounts (this is a relative term, not an absolute term).

The neuropeptides, when the immune system is supercharged by getting rid of the microbes, quickly destroy the cancer cells.

It can take six months for the Bob Beck Protocol to get rid of all of the microbes in the bloodstream. (Note: The protocol should continue for life or the microbes will come back.) Exactly how long it takes the immune system to be fully recharged is unknown, but likely the immune system starts to become effective against cancer within six or seven weeks of starting the protocol.

The contribution of Dr. Bob Beck, Ph.D. (his Ph.D. was in physics and he taught physics at USC in California) should not be underestimated.

The point is that the Bob Beck Protocol should be used by every cancer patient who is not on chemotherapy or other toxic drugs (there are also a few alternative cancer treatments which should not be used with the Beck Protocol). These drugs cannot be used with electromedicine because of electroporation, which is a phenomenon which would allow the drugs to get inside of the wrong cells.

However, the Bob Beck Protocol should not be the primary cancer treatment at the beginning of the treatment. It can take three or more months for the protocol to make a difference. Other protocols, which start working much more quickly, need to be used at the beginning of a treatment for an advanced cancer patient.

Another absolutely forbidden substance when using this protocol is garlic. Garlic should never be used by any human being because it kills brain cells. However, we all have so many brain cells, as Bob Beck points out, that it is really no big deal to take a reasonable amount of garlic.

Herbal products should not be used within two hours of the Bob Beck electromedicine devices.

- Videos of Bob Beck at [Granada](#) and [Ventura](#).

Supplements help build the immune system

It has been known for many years that some plants and other natural substances help build the immune system without getting rid of all of the microbes in the bloodstream. Certain mushrooms have been particularly identified as being helpful for the immune system.

Now there are many supplements that help build the immune system by providing the immune system the right nutrients. No other product rivals the efficacy of [Beta-1, 3D Glucan](#).

So, is it a good idea to take glucan to help prevent cancer? From Dr. Vaclav Vetvicka, Vice Chairman and Director of Research at the Department of Pathology and Laboratory Medicine at the University of Louisville: *“Yes. Glucan will help protect you against cancer and many other illnesses that would normally be eradicated by a fully functioning immune system.”* — *Beta Glucan: Nature's Secret*, p. 49.

The only brand of glucan suitable for my readers is the Transfer Point Brand. [Click here](#) for more information on unlocking your immune system; or call (800) 746-7640 to speak with Better Way Health, the experts on Beta Glucan.

(I used to recommend the 4Life brand of Transfer Factor Plus. I have since discovered research from a well-known university that scientifically proved this product is 160x less effective than the Transfer Point Beta Glucan.)

Here is a list of other immune builders:

- A Beta Glucan Supplement: “Beta-1,3D Glucan” [made by Transfer Point] (\*) [Recommended]
- [IP6](#) ([Inositol](#) hexaphosphate)
- Organic Germanium

- MGN3 / MGN-3 (available in the U.S. under the brand name: BioBran)
- An AHCC Supplement: Immpower, ImmunoKinoko, Immune-Assist includes AHCC
- Immune Fx
- Zeolites (heavy metals interfere with the immune system, zeolites remove heavy metals)
- Aloe Immune glyconutrient product (see my Stage IV article)
- Moducare (a sterols and sterolins supplement)
- Garlic — whole bulbs or a supplement designed for immune system (use only during active cancer treatment)
- RM-10 Ultra [Garden of Life]
- Oncolyn

(\*) — product is endorsed by Bill Henderson

My Touchstone Essentials is a vendor of Pure Body Extra Strength (spray), to chelate the blood, and Pure Body (liquid), to chelate the colon:

There are many other products that claim to build the immune system (e.g. Lentinan, PSK, PSP, Coriolan, D-Fraction, Mushroom Immunity Complex, etc.). Be aware that every vendor claims their product is the best and also remember that Cancer Tutor has no lab facilities to test their claims! MGN-3 or BioBran has a single manufacturer, and has been studied in labs, but found to be very ineffective compared to the Transfer Point brand.

However, MGN-3 or MGN3 has been so severely persecuted by the FDA that its availability and brand name changes from time to time.

Junk foods

Many people say that sugar and other junk foods cause cancer. Well, to some degree that is true.

What junk foods do is put high levels of highly concentrated acidic foods in the body. Microbes love an acidic environment.

Thus, junk foods create the perfect environment for the microbes that are in the bloodstream, the microbes in the organs and even the microbes inside the cancer cells.

That is why cancer diets avoid highly acidic foods and focus on whole (i.e. unprocessed), alkaline foods.

Even in natural medicine cancer can come back

Many natural cancer treatments, whether cancer treatments that kill the cancer cells or even revert the cancer cells into normal cells, can have significant regression rates.

One reason was discussed above, the microbes in the organs and / or bloodstream were not identified and destroyed.

In other words, even natural cancer treatments that kill cancer cells or revert cancer cells into normal cells can have the cancer return. If natural cancer treatments don't fix the root cause of cancer, by cleaning the blood, and especially the organs of microbes and parasites, cancer can come back.

How to cure cancer

In summary, there are several ways to cure cancer:

- 1) You can safely and gently kill the cancer cells with nutrients, such as laetrile or Vitamin B17.
- 2) You can safely and gently kill the microbes which are inside the cancer cells with DMSO, MSM, honey, as Trojan Horses, and electromedicine or other tactics.

The Dirt Cheap Protocol is loaded with these types of treatments. And these treatments are very synergistic with each other.

3) You can safely and gently kill the microbes which are in the bloodstream and thus supercharge the immune system to create interleukin and interferon and other neuropeptides, which in turn kill the cancer cells (e.g. the Bob Beck Protocol or High RF Frequency Generator with Plasma Amplifier devices),

(Note: The High RF Frequency Devices are direct cancer treatments. They not only kill the microbes in the bloodstream they also kill the microbes inside the cancer cells and revert cancer cells into normal cells. So do not compare a High RF Frequency Device with a Bob Beck device.)

4) You can target and kill the parasites and microbes in the organs, which will also help supercharge the immune system (e.g. the High RF Frequency Protocol consultation). On this website, this is called a “liver flush” because the most important parasites are in the liver.

5) You can supercharge the immune system with nutrients. This can also cure cancer though it does not work as fast as some of the other treatments. Many natural plants have been identified which can build the immune system without killing all of the microbes in the bloodstream (or perhaps some of them work by killing microbes in the bloodstream and no one realizes that that is the way they work).

6) You can block the lactic acid cycle with hydrazine sulfate (i.e. hydrazine sulfate) (this is not a direct cure, but it extends the life of the patient so other treatments have longer to work).

7) You can supercharge the non-cancerous cells with nutrients and minerals. Note: this is not a direct cure, but is very commonly used to extend the life of the patient until other treatments can become effective. In fact, it is frequently the first thing that is done. Eniva Vibe is superb at doing this.

A typical cancer treatment will actually do three or four of the above things and maybe all seven of them.

If I were going to use the Bob Beck Protocol I would certainly also use plant and herbal protocols which also help build the immune system, however, I would not use the supplements and herbal products within two hours of the Bob Beck Protocol.

But remember that the Bob Beck Protocol does not start to become effective quickly so it should never be a high priority at the beginning of the treatment.

Cancer is a systemic disease. It is caused by microbes in the organs (which weaken the immune system), microbes inside the cancer cells (which block the production of ATP energy), microbes in the bloodstream (which block the immune system), and so on.

Introduction to advanced cancer theory

Prior to reading this article it is essential to read the article: “What Causes Cancer.” That article explains that cancer is caused by a microbe, almost certainly *Helicobacter Pylori*, when it gets inside of normal cells or when a cancer cell divides and creates two daughter cancer cells which each have these microbes. See: [What Causes Cancer](#)

This article expands on that article.

The evidence that *H. Pylori* causes cancer is very solid. For example:

1. It is ubiquitous in the stomach and common in the bloodstream (all humans have some cancer cells at all times),
2. It is known to be a pleomorphic microbe,
3. The most effective herb at killing *H. Pylori*, [turmeric](#), is also the same herb that is most effective at treating cancer,

4. More than one alternative cancer researcher has come to the same conclusion independently.

But regardless of what the cancer microbe is, it has been known since the 1930s that one of the best ways to cure cancer is to kill the microbes which are inside of the cancer cells. In this way the cancer cells will revert into normal cells.

A surprising number of alternative cancer treatments work by killing the microbes inside of the cancer cells. A short list of these treatments include:

1. Vitamin C by I.V.,
2. Ultraviolet light,
3. All DMSO protocols,
4. All MSM protocols,
5. And so on.

For most alternative cancer treatments the size and shape of this microbe is irrelevant, but for two categories of alternative cancer treatments the sizes and shapes of this microbe are critical to understand because they can affect the killing of this microbe and/or the issue of cancer remission.

These two categories are highly alkaline protocols and electromedicine protocols that work by vibrating this microbe until it bursts (e.g. Royal Rife or “frequency generator” protocols).

The cancer microbe is a highly pleomorphic microbe. Here is a chart of the 16 different sizes (not to proportion) as discovered by Gaston Naessens and published in the book: The Persecution and Trial of Gaston Naessens, by Christopher Bird:

The above chart does not show the proportional sizes or the shapes of the cancer microbe. The size and shape turn out to be

significant, especially in the larger and smaller forms of the microbe.

The size of the cancer microbe can literally be much smaller than a virus (which is why it can get inside of the cell nucleus and damage the cell DNA), but can be as big as a red blood cell.

This article will discuss the importance of these shapes and sizes in the treatment of cancer.

### Cancer theory and alkaline treatments

The cancer microbe changes its shape and size based on the acidity or alkalinity of the inside of the cell.

As the alkalinity inside the cancer cell goes up, the size of the cancer microbe goes down. As the alkalinity of the inside of the cancer cell goes down (i.e. the acidity goes up), the size of the cancer microbe goes up.

We can look at any calcium or cesium chloride protocol (and possibly baking soda) to understand what is going on inside the cancer cells.

As calcium or cesium chloride get inside the cancer cells, the alkalinity of the cancer cells goes sky high.

If the calcium or cesium gets inside the cancer cells fast enough, it may kill all of the microbes inside the cancer cells and the cancer cells will revert into normal cells.

However, in some cases the microbes may be able to survive the highly alkaline substances. As the alkalinity inside the cells goes up, the microbes that are not killed may go into hibernation (the “Somatid” state in the above chart).

When this microbe is in hibernation, it cannot be killed by anything. This has actually been observed by several different

cancer researchers (who, by the way, called this microbe by different names, such as “bion,” BX or “microzyma”).

In the book: *The Persecution and Trial of Gaston Naessens* is this quote:

... over the years somatids were revealed to be virtually indestructible. They have resisted exposure to carbonization temperatures of 200 degree C and more. They have survived exposure to 50,000 rems of nuclear radiation, far more than enough to kill any living thing. They have been totally unaffected by any acid. Taken from centrifuge residues, they have been found impossible to cut with a diamond knife, so unbelievably impervious to any such attempts is their hardness.

Page 5

While not in the somatid state, the alkalinity inside of cells makes these microbes lethargic, which largely neutralizes the damage they are doing. These microbes damage the body and cancer cells in several ways, but in this context I am talking about the fact that they can force the cancer cell to replicate very quickly.

If the alkalinity does not occur fast enough, and thus does not kill these microbes, the microbes may eventually go into the somatid or hibernation state.

If these microbes go into hibernation, the cancer cells will be able to restore their metabolism and will appear to be normal cells. In other words, when in hibernation these microbes do not intercept glucose and do not excrete mycotoxins. So just like when these microbes are killed, the cancer cells revert into normal cells.

But in these cases the cells appear to be normal cells, and act as if they were normal cells, but in fact they are still cancer cells in the sense that there are still microbes inside the cells.

When the person stops or changes their cancer treatment, and goes off of their alkaline cancer treatment, and goes back to their old acidic diet, eventually the inside of the cancer cells gets acidic

and the microbes come out of hibernation and the cancer “returns” in the same location it was before.

Actually, the cancer cells never left, they simply “went into hibernation” because the microbes were in hibernation. When the microbes came out of hibernation they started intercepting glucose again and excreting mycotoxins again. The cells again acted as if it were cancerous.

This is a key sign as to what is happening, the cancer returns in exactly the same location it was before. Thus, the new cancer is not caused by “new cancer cells,” it is caused by “old cancer cells” which were cancer cells which reverted into being normal cells, but when the cell interior again became acidic the somatids came out of hibernation and again started intercepting glucose and excreting mycotoxins.

This is why I tell people who are using an alkaline protocol as their cancer treatment, that when they are done with their treatment they need to go on a different cancer treatment that does not use alkalinity at its foundation. Or they need to stay on an alkaline diet for life to keep the microbes in hibernation (and keep the cancer from coming back).

The alkaline protocols (e.g. calcium, cesium, etc.) are very good protocols and are absolutely critical to keeping advanced cancer patients alive. Nothing can keep advanced cancer patients alive as well as these protocols. These protocols have saved many, many lives, so this is not a criticism of these protocols.

My point is, as I say on other web pages, that when a cancer patient finishes one of these protocols they must either stay on an alkaline “cancer diet” for life or they must switch to an alternative cancer treatment that does not depend on alkalinity, such as the Ultimate Simple Protocol or Plasma-Beck protocol. While these protocols do have some alkalinity in them (via a small amount of baking soda), they are not alkaline enough to put the microbes

into hibernation or keep them in hibernation. They only have enough alkalinity to slow down the spread of cancer.

### Cancer theory and electromedicine treatments

It has been demonstrated many times that if you kill all of the microbes inside of a cancer cell, the cancer cell will revert into a normal cell.

One of the ways to kill these microbes is with electromedicine, especially if the electromedicine device has a “carrier wave.” The only such devices I know of are the two High RF Frequency Generator “frequency generators.”

So how do these devices kill the microbes which are inside of a cancer cell?

It is generally believed that each of the 16 shapes and sizes of the cancer microbe has a different “Mortal Oscillatory Rate” or M.O.R., meaning they have a different frequency at which they vibrate until they explode and die.

Think of a wine glass being shattered by an opera singer. At a certain frequency the glass will shatter. Likewise, each microbe has a specific frequency (i.e. M.O.R.) at which it will “explode” and die.

In theory, this would imply that it would take 16 different frequencies to kill the “cancer microbe.” Well, it is not that simple.

The Independent Cancer Research Foundation will determine these frequencies if they ever get enough funding. But for now understand that it has been shown by those using electromedicine, by trial and error, that taking some ionized water makes the device more effective.

This makes perfect sense because at the larger sizes and shapes, finding an effective frequency to vibrate them until they explode

may be very difficult. This may be exacerbated by the shapes of the larger sizes. Some shapes may prevent a uniform and consistent vibration.

By taking some ionized water the alkalinity inside the cancer cells will go up and the size of the microbes will go down into the mid-size range of the microbe sizes.

However, it has also been shown that when too much ionized water is taken, in conjunction with an alkaline treatment, that the microbe becomes too small to kill by the frequency range of the device.

These conclusions were based on case studies.

Much more research needs to be done in this area, but for now realize that the cardinal rule of using electromedicine is to take a reasonable amount of ionized or alkaline water, but do not be fanatical. By using moderation the size and shape of the cancer microbe will be in the middle range and it will be easier to kill the microbes by using vibrations.

This is a highly theoretical discussion, but the theory coincides with the actual success of the devices.

Final comments and summary

This article is in no way a criticism of the alkaline or electromedicine protocols. They are superb protocols that can do things no other protocols can do. Many, many cancer patients are alive today because of these protocols.

In fact, as the “[Understanding Treating Cancer](#)” article explains the alkaline “super protocols” are the highly recommended protocols for very advanced cancer patients.

However, it is important to understand key principles in how to maximize the effectiveness of these protocols.

With alkaline protocols the way to maximize their effectiveness is to use a non-alkaline cancer protocol when the alkaline protocol is completed or to stay on an alkaline diet for life.

With electromedicine protocols the way to maximize the effectiveness of these protocols is to use some alkalinity to put the microbes in the middle size range, but to not use too much alkalinity. “Moderation” of alkalinity is a good term.

Cancer research by others

The ICRF is not the only cancer research organization in the United States, much less throughout the world. Here are links to other cancer research going on around the world:

[Cancer Research on Deuterium Depletion \(the research is in Hungary\)](#)

[The Gabor Somyais book](#)

The Big Picture

All cancer patients should study this article carefully. It is the main article which discusses very critical issues needed for surviving cancer. This article should be read every month at least once, from top to bottom.

Since 2002 we have communicated with many thousands of cancer patients or their representatives. In many cases, the emails we have received included a proposed treatment the cancer patient or their representative put together. In some cases their proposed treatment was a single treatment, such as carrot juice or [laetrile](#) ([vitamin B17](#)) or enzymes, etc.

Here is why a person might pick a single treatment. Suppose they see a testimonial on the Internet which talks about a person who

cured their newly diagnosed liver cancer with carrot juice. Is the testimonial truthful? Most likely it is truthful. But does this testimonial mean that carrot juice, by itself, will cure ALL cancer patients?

Many, many natural substances can cure slow-growing cancers which have not spread very much and the patient is newly diagnosed and the patient has never had any chemotherapy, radiation or major surgery. But such cancer patients are rare indeed.

The typical cancer patient today who seeks out natural medicine, has had extensive chemotherapy and radiation (and may still be using them) and has probably had some major surgery.

Their cancer has already spread significantly, the cancer is spreading quickly, their immune system has been destroyed for several reasons, they have large amounts of lactic acid in their bloodstream (which is one of many things that can make a cancer patient weak), (1) their liver and bloodstream are full of microbes, their digestive tract can barely extract nutrients from any food because of damage by chemotherapy, and so on.

Advanced patients have “one foot in the grave and the other on a banana peel” (as we say in the United States). Carrot juice, by itself, will not cure such patients. Nor will laetrile or hydrogen peroxide, by themselves.

Picking a single cancer treatment, *any* single treatment, is the most common mistake made by cancer patients who are new to alternative medicine. They do not understand that the power and speed of the protocol must be greater than the power and speed of the cancer.

We are going to say that again because it is so important: The power and speed of the protocol must be greater than the power and speed of the cancer.

That is why a person must know at the beginning of their treatment what the “power and speed” of their protocol is.

Also, many alternative cancer treatments can be combined. Much of this article is to explain why several alternative cancer treatments need to be combined to treat the cancer. They are combined either to be synergistic or to do different tasks.

This website contains some very old articles, so the terms “treatment” and “protocol” are not consistently used. But we will tell you how they should be used. A “treatment” is a single treatment, such as laetrile or enzyme therapy or carrot juice, etc. A “protocol” is a combination of several “treatments.”

Why is a “protocol” needed? The reason is that an advanced cancer patient needs help in several different areas. A “protocol” should be designed to deal with *several* different issues.

Furthermore, some of the individual treatments in the protocol should have a reputation of curing cancer by itself. For example, someone once asked if the Collect-Budwig protocol had ever cured cancer. We mentioned six treatments in the Collect-Budwig protocol, each of which had cured cancer by themselves. Most of the protocols on this website also contain several treatments, most of which have cured cancer by themselves or they have some specific purpose for being in the protocol.

But there is more to it than that. For example, if someone has fast-spreading cancer they will need one highly alkaline protocol (a person should generally not use more than one highly alkaline protocol at a time, except at the beginning of their treatment for a short time) or one or more potent oxygen protocols or both. This is to slow down the spreading of the cancer so the treatment will have more time to work.

Before going on, let's talk about what causes cancer so we have an idea of how to treat cancer.

---

## What Causes Cancer?

Orthodox medicine would like you to believe that DNA damage causes cancer. While cancer cells may have DNA damage, the DNA damage is actually caused by the same thing that causes cancer. In other words, the DNA damage is a parallel symptom of cancer.

If you do not understand how microbes cause cancer, see the “What Causes Cancer” article (and then come back to this article). Here is the article:

### What Causes Cancer

Note that if you kill all of the microbes inside the cancer cells the cancer cells will revert into normal cells. If you make the microbes lethargic, the cancer cells will not divide as quickly and the spreading of the cancer will slow down, thus giving you more time to cure the cancer.

---

## Important Notes About Alternative Cancer Treatments

Note #1: More details about these items, and other critical issues, are discussed later in this article and in other articles.

---

Note #2: The term “electromedicine” in alternative medicine refers to very, very gentle electrical devices. Generally, the patient cannot even feel the device is turned on. Do not confuse these devices with the normally barbaric radiation therapy of orthodox medicine. However, radiation therapy can be useful in some situations by shrinking dangerous tumors and/or in stopping bleeding.

---

Note #3: Special treatments have been designed to quickly get the cancer patient out of danger and thus “buy time” by keeping the cancer patient alive in order to give more powerful treatments (which may start to become effective very slowly) more time to work. Do not purchase an expensive “buy time” device unless you have enough money left over to purchase the main treatment. Most cancer patients need to budget their money so they need to consider the cost of all items before they commit to buying something very expensive.

---

Note #4: There are many natural medicine clinics around the world. Some of them offer treatments that cannot be used at home. And, of course, the best ones offer excellent advice. There are also consultants to help you pick the right treatment and the right clinic.

Here is the article which lists some clinics and discusses many issues related to natural medicine clinics around the world:

[A Sample of Alternative Medicine Clinics](#)

---

Note #5: We are fully aware that while some patients can easily afford (or at least can obtain the funding) the best and strongest of the natural cancer treatments, most cannot afford the best treatments. There is a financial product which allows terminal cancer patients to obtain the funding for their natural cancer treatment. There are companies that purchase life insurance policies (e.g. at 75 percent of face value) of terminal cancer patients. This money can provide the funding to give the family quality time with the patient (e.g. to travel together) and/or to buy products or visit clinics that may save the patient's life.

For example, suppose a person as a \$200,000 whole life insurance policy and a \$50,000 term life insurance policy. The chances are that they can “sell” the \$50,000 term life insurance policy (if it can be converted into a whole life policy) and have enough funds to pay for one of the best natural medicine cancer treatments.

See this article for more details:

[How To Fund a Treatment Without Borrowing Any Money](#)

---

Note #6: We are very aware of the reality that because of the medical industrial complex, and for many other reasons (such as the country a patient lives in), many cancer patients cannot afford even the basic natural cancer treatments.

We have written two articles which help such patients get highly effective cancer treatments within their budget. The first is the “Dirt Cheap Protocol.” We pay close attention to this article because it is probably the most-used protocol on this website because so many people don't have the money for one of the major protocols:

[Dirt Cheap Protocol](#)

This article is not a complete protocol, but it gives cancer patients a whole host of options for putting together their own protocol:

[Inexpensive Cancer Treatments](#)

---

The Objectives of an Alternative Cancer Treatment

Here are the main objectives in treating cancer with natural medicine.

## Objective #1: “Buy Time” By Energizing Non-Cancerous Cells

There are specialized cancer treatments that work very quickly and “buy time” to keep the cancer patient alive in order to give other, more powerful treatments more time to work. This is the top priority in dealing with advanced cancer patients and generally involves energizing the weak non-cancerous cells with electromedicine and/or super-nutrients because the non-cancerous cells can be very, very weak. It also includes not eating foods that feed the cancer cells (e.g. dairy products, sugar, etc.).

Examples of “buying time” would include the High RF Frequency Protocol (electromedicine), Quantum Pulse (electromedicine), BioCharger (electromedicine), Vibe liquid, the Budwig diet, etc.

The products that “buy time” can generally be used during the entire cancer treatment, but they are considered to be a “buy time” protocol because they start working very quickly to stabilize the patient. But they can also have great benefits throughout the treatment.

The High RF Frequency Protocol is especially important because it both energizes cells and kills microbes in the liver, lymph and bloodstream.

### High RF Frequency Protocol

Less expensive options to “buy time” include the supplements (these can be used with the electromedicine devices): D-Ribose, Vitamin C, Vibe liquid (in the orange bottle), the Budwig diet, carrot juice, and many other dietary supplements which help “feed” the weak non-cancerous cells. Anything that floods the body with nutrients will help.

---

Objective #2: “Buy Time” By Slowing Down the Spreading of the Cancer

Stopping or slowing down the spreading of the cancer is critical. This is the second part of “buying time.” This is usually done with alkaline protocols or an alkaline diet which makes the inside of the cancer cells alkaline and

thus makes the cancer microbes lethargic or kills them. Examples would be Collect, cesium chloride, calcium (e.g. coral calcium), barley, alkaline water, etc.

This is a very critical issue for advanced cancer patients. More will be said about this later in this article.

A special article has been written on how to quickly get started fighting the cancer. It is the “What To Do Today” article. This article tells you how to jump-start your cancer treatment TODAY. It also tells you how to phase over to the main cancer treatment as the items in the main cancer treatment start to arrive. Here is the article:

### What To Do TODAY

---

#### Objective #3: “Buy Time” By Dealing With Cachexia

Cachexia is a deadly cycle. Cancer cells create lactic acid. The lactic acid then travels to the liver (the bloodstream becomes full of lactic acid). Once in the liver, the lactic acid is converted into glucose. Guess what, the glucose goes to the cancer cells and more lactic acid is made. Both ends of this cycle (the liver and the cancer cells) consume large amounts of energy, plus the lactic acid in the bloodstream makes a cancer patient weak, among other things.

By one estimate, cachexia kills 40 percent of cancer patients. Chemotherapy does absolutely nothing to stop the lactic acid cycle.

Getting rid of the lactic acid in the bloodstream (lactic acid blocks non-cancerous cells from getting nutrients and energy) is generally done with MSM (methyl-sulfonal-methane). There are several MSM protocols on this website.

Another option is to block the liver from creating glucose is hydrazine sulfate or hydrazine sulfate. This product requires expert support because it can be dangerous to use. Any compound chemist can make hydrazine sulfate but it is best to buy it from The Wolfe Clinic. The Syracuse Clinic in New York is where the expert support normally comes from.

Some things can get nutrients to the non-cancerous cells in spite of the lactic acid blockade. Examples would be Vitamin C (where it does not conflict with another treatment), D-Ribose, and perhaps other things.

D-Ribose, which is available at any health food store, and Vitamin C are very important because they can get past the lactic-acid blockade to get nutrients into the non-cancerous cells.

The “MSM/Vitamin C” protocol was designed specifically for cleaning lactic acid out of the blood and to revert many cancer cells into normal cells. By cleaning the blood of lactic acid, less of the lactic acid gets to the liver and thus the cachexia cycle is at least partially broken.

For those on the Collect-Budwig treatment, or any other treatment that uses the Budwig diet, they should use the “MSM/CS” or the less expensive and more powerful “MSM/CD” or “MSM/LIPH” protocols (see the left side bar).

Why would someone use the “MSM/CS” protocol instead of the more potent and cheaper “MSM/CD” protocol? The chlorine dioxide in the MSM/CD is very hard on the stomach so it is too intense for some patients.

LIPH, a homeopathic product, has cured cancer by itself, so the MSM/LIPH protocol is gaining in respect. It is so inexpensive that it could and should be added to any other protocol.

Note: the reader might wonder why building the immune system is not among the highest priorities. It actually is. The High RF Frequency Protocol actually works by supercharging the immune system. So does the Bob Beck Protocol, though it does not work as quickly. Other protocols will likely include supplements that build the immune system with special nutrients.

---

#### Objective #4: Safely and Gently Kill Cancer Cells

Many natural products are able to safely kill cancer cells. A good example is fucoidan which is a molecule found in high levels in some brands of “Fucoidan.” Laetrile (found in apricot kernels) is another example, but it is not as effective as fucoidan unless used as an I.V. at a clinic.

Purple grapes have about a dozen molecules which can kill cancer cells. Carrot juice also has molecules which can kill cancer cells.

The immune system is the ultimate killer of cancer cells. However, orthodox cancer treatments can damage the immune system to the point it is significantly less effective than it should be.

Many natural substances and special products, and even electromedicine can help build the immune system. The GB 40000 is an excellent example. The Bob Beck, which works much more slowly, is another.

But killing cancer cells does not depend on the immune system, it can be done directly.

In fact, most natural medicine protocols both kill cancer cells, revert cancer cells into normal cells and supercharge the immune system.

This is one reason for the “buying time” protocols because the “buying time” protocols keep the patient alive to give other treatments more time to become effective. This is usually another goal of a natural medicine treatment.

Some people claim that Vitamin C, hydrogen peroxide ([Hydrogen Peroxide Vendor](#)) and ozone ([Hydrogen Peroxide and Ozone Book Vendor](#)), to name but three treatments, can kill cancer cells. We seriously doubt this is the case. They most likely work by killing the microbes inside the cancer cells, which in turn allows the cancer cells to revert into normal cells. This tactic will be discussed next.

---

#### Objective #5: Revert Cancer Cells into Normal Cells

DMSO and MSM (and sometimes honey) are commonly used to revert cancer cells into normal cells. They do this by helping microbe-killing substances to get inside the cancer cells to kill the microbes that are causing the cancer (did you read the “What Causes Cancer” article so you know what we are talking about?).

Most DMSO protocols are discussed on the website of the Independent Cancer Research Foundation, Inc. The exception is the newest “Overnight Cure For Cancer,” the Version 7 protocol, which is found on this website. The MSM protocols (e.g. MSM/LIPH, MSM/CS, etc.) are discussed on this website.

Gentle electromedicine can also effectively kill the microbes inside the cancer cells by using special “carrier waves” to get the devitalizing microbe-killing frequencies past the cell membrane. We should mention that only one brand of “Rife Machine” has the necessary “carrier wave” frequency. These are in the High RF

Frequency Generator family of “Rife Machines”. Here is a vendor of these instruments if you want to see what they look like (copy and paste this URL into a browser): [www.FrequencyStore.com](http://www.FrequencyStore.com)

While there are about a hundred different “Rife Machines” on the Internet, only the two High RF Frequency Generator devices actually have a powerful carrier wave and the massive numbers of frequencies needed to revert cancer cells into normal cells (e.g. they run up to 8 frequencies at the same time).

The High RF Frequency Generator utilize normalizing and stimulating frequencies which energize all cells. These generators are primarily designed to revert cancer cells into normal cells and clean the blood, liver, etc. of microbes.

The other brands of “Rife Machines” may have some benefits, but their benefits are generally limited to killing microbes in the bloodstream (e.g. which is what the Bob Beck Protocol and Hulda Clark Zapper do) and killing microbes and other parasites in the liver, etc.

The High RF Frequency Generator family, however, actually reverts cancer cells into normal cells by killing the microbes which are inside the cancer cells. When these microbes are dead the cancer cells will revert into being normal cells.

---

#### Objective #6: Deal With Inabilities to Digest Foods

Due to a variety of factors, the stomach and colon may not be able to extract all nutrients from foods and supplements. This is because of the damage done to the digestive tract by chemotherapy, surgery, and radiation.

Even people who do not have stomach or colon cancer and/or have not had stomach or colon surgery can have a largely worthless digestive tract due to chemotherapy and/or radiation.

Chemotherapy kills fast-growing cells and many of the cells in the stomach and colon are fast-growing cells.

Electromedicine (e.g. the High RF Frequency Generator with plasma amplifier) is by far the best way to deal with this issue because with electromedicine nothing needs to be digested to get rid of the cancer cells.

Some other protocols, such as the DMSO and MSM protocols, do not contain anything that needs to be digested.

A special and powerful protocol, the Overnight Cure For Cancer (a DMSO protocol), was designed specifically for people with a blocked stomach and/or blocked colon, thus it will help those with stomachs which cannot digest foods.

We should mention that DMSO protocols cause several body odors for many hours. For that reason, many cancer patients (i.e. those who have jobs where they work with the public), cannot use DMSO protocols.

There was a medical doctor clinic in Atlanta, Georgia who used DMSO and very low dose chemotherapy (about 1/10th the normal dose of chemotherapy). It was a superb treatment because the DMSO allowed the chemotherapy to target cancer cells. However, the Food and Drug Administration (FDA) shut the clinic down.

We mention this because anyone who is still using chemotherapy or Vitamin C by I.V. needs to take MSM (a close cousin of DMSO but without the body odor), roughly 30 to 40 grams (after building-up, of course), just before leaving home to take the chemotherapy or Vitamin C. See the article "[If Still on Chemo or Radiation.](#)"

Electromedicine, especially the High RF Frequency Protocol can be added to the Overnight Cure for Cancer to directly revert cancer cells into normal cells, kill microbes in the organs, etc.

In other words, use the Overnight Cure For Cancer plus the High RF Frequency protocol for those who cannot digest food.

---

### Objective #7: Work With an Expert

This should be #1, but we list other things first so the patient or caregiver knows what to look for in expert support.

For example, Mike Vrentas supports the Collect-Budwig protocol. The Wolfe Clinic supports the Cesium Chloride protocol. The High RF Frequency Protocol is supported by the GB 4000 vendor.

Dealing with cancer is not a “trial-and-error” exercise. You **START** with the experts who have many years in this business.

Clinics, of course, have expert support built-in.

### Objective #8: Make the Patient “Whole” Again

As has already been mentioned, cancer is caused by a weak immune system. The immune system is weak because of microbes in the liver, other organs, and in the bloodstream. So how do you get rid of these microbes.

If you use the High RF Frequency Protocol, the methods are designed specifically to target microbes.

But what if you cannot afford one of these options or you use a different protocol?

What we would suggest is to do two things.

First, use the [Bob Beck Protocol](#). If you cannot afford these devices you should be able to find someone to build them. The schematics are on this website.

This devices will get rid of all microbes in the bloodstream and lymph system and will get rid of many of the microbes in the organs.

Second, we would also use a combination of liver and gallbladder flushes. There is a simple liver flush on this website:

[Liver Flush Article](#)

However, we would also try to find Hulda Clark liver flushes or Hulda Clark parasite cleanses. There is a line of products which have her protocols.

There are many websites that claim to have Hulda Clark Zappers, but we have not had the time or funds to check out if any of these devices will deal with all types of liver flukes, roundworms, tapeworms, fungus, etc. etc. that live in the organs.

There is also a device that can tell you if you have been successful at eliminating these microbes and parasites. The device is made by the [Zyto Corporation](#). Zyto devices can identify where there are microbes in the body and which microbes they are. You will have to find one near you as they are only at clinics. Here is their website:

[Zyto Corporation](#)

Objective #9: Keep the Bloodstream Free of Microbes

The ICRF believes that melanoma, squamous cell carcinoma, sarcoma and uterine cancer are cancers that require treatments which clean the blood of microbes every 12 hours. These cancers spread via microbes coming outside of the cancer cells, then the microbes travel in the blood to another location and colonize another section of cancer. This is why it is critical to keep the blood free of microbes for these types of cancer.

Most cancers may spread this way or by microbes coming out of the liver or lymph system. Thus, all cancer patients need to keep microbes out of the bloodstream, liver and lymph system (the liver will be discussed in a moment).

In addition to preventing the spread of cancer, Dr. Bob Beck, a PhD in physics, proved that if you clean the blood of microbes the immune system will become supercharged. But this is a slow process and is not why this item is listed in this section.

Not all packaged cancer treatments include something that will get rid of the microbes in the bloodstream. But yet it is suspected that most if not all, cancers spread at least partly in this manner.

But even if you don't have a High RF Frequency Generator you still need to get rid of the microbes; not just to build the immune system, but to keep cancer from spreading from other cancer cells, infected dental work or from the liver or lymph nodes to other locations.

The Bob Beck Blood Purifier is the best way to deal with this issue if you do not have a High RF Frequency Generator or use a Hulda Clark Zapper two hours a day.

Dental infections need to be dealt with by very, very specialized and rare dentists. Not even “biological dentists” are qualified to deal with these infections. Contact the “Huggins Applied Healing” website to find one of these dentists in your area.

One last comment about the High RF Frequency Generator devices. The High RF Frequency Generator (with 15-watt linear amplifier) device can be used twice a day, once in the morning and once in the evening. Each time use it the recommended times. The High RF Frequency Generator (with plasma tube amplifier) can be used twice a day, depending on the protocol used and the patient. Some patients can tolerate it twice a day and some cannot.

Either way, do NOT try to use it twice a day until you have been using the device for at least 10 days.

#### Objective #10: Deal With Oxidation Damage

Coconut water helps with the symptoms of chemotherapy. The article for those [still on chemotherapy](#) goes into detail about these issues.

#### Objective #11: Get Rid of Microbes, etc. in the Dental Areas

One of the reasons there are so many microbes in people's bloodstream is because of “modern dentist” who are trained to create safe-havens for microbes, put mercury and other toxins in your mouth, etc. etc.

Of course, that is not the way they describe what they do, but that is what they actually do.

Getting rid of microbes in the dental area is an entirely different issue and requires electromedicine (e.g. special frequencies of the High RF Frequency Generator) or dentists trained by Dr. Hal Huggins. See these two chapters on dental work:

[Chapter 7 of book](#)

[Chapter 8 of book](#)

#### Objective #12: Have a Good “Cancer Diet”

What the cancer patient eats and the special supplements the patient takes can have a huge impact on survival. Dr. William D. Kelley, a dentist, had a 90 percent cure rate on thousands of cancer patients by using nothing but a superb diet and special supplements (e.g. carrot juice, proteolytic enzymes, etc.).

While the [Kelley protocol](#) is rarely used any more because of newer products, it should be a lesson-learned for cancer patients that special supplements and a good cancer diet can have a huge impact on cancer survival.

Many packaged cancer treatments have a few of the Kelley supplements, but my point is that a cancer patient should drink carrot juice (which a little beet juice mixed in) and other special foods every day.

If you are not on the Cellect-Budwig or Bill Henderson protocol, see this article as an example of a “raw food” diet:

The Cancer Diet

Also, even if you do not use the Cellect-Budwig, the \$35 or so for the Mike Vrentas lectures are worth the cost. I recommend the lectures on CD because it is easier to listen to them over and over again. Here is his website:

Mike Vrentas Lectures

Objective #13: Deal With Pain and Other Symptoms of Cancer

The best way to deal with pain is to work with the experts who support one of the major cancer treatments.

The experts who support the Cellect-Budwig and Cesium Chloride protocols can deal with pain.

In addition, the High RF Frequency Generator electromedicine devices (which have specific frequencies for pain), TENS units, Vibe Machine (now called Quantum Pulse), etc., can all help deal with pain.

But we will warn you that dealing with pain can be elusive.

TENS units are very inexpensive and can be very helpful. However, like the zappers, the ICRF has not had the time or money to research the various brands. Any feedback, good or bad, would be helpful.

DMSO liquid is also good at dealing with pain, but it is rarely used because it creates severe body odor (which the patient cannot

smell). See [this article](#) on this website to learn the safety rules for using DMSO.

#### Objective #14: The Thyroid and [Iodine](#)

One of the key issues in dealing with cancer is dealing with the lymph system. Iodine can thin out the lymph system which can be critical for a cancer treatment.

Three of the best-known cancer doctors, Dr. Hoxsey, Dr. Gerson and Dr. Moerman, all included some form of iodine in their treatments. Potassium iodine was a key ingredient in the Hoxsey herbal tea.

However, dealing with the chemistry of the body, and iodine, in particular, is something only experts should deal with. When you work with your consultant make sure you mention what doses of iodine he or she recommends.

Here is an introductory article on hormones with some references. But the ultimate answer lies with the expert you are working with: [The Thyroid, Hormones, and Cancer](#)

#### Objective #15: Deal With Potential Brittle Bones (Bone Cancer)

Cancer patients with bone cancer can ultimately get “brittle bones” which break easily. This is far more dangerous for cancers of the spine, but it can be dangerous for any type of bone cancer.

The solution is an expertly put together mineral protocol to protect the bones.

For those on the Cesium Chloride protocol, Larry, who supports this protocol, is such an expert.

The product Collect, in the Collect-Budwig protocol, also has these minerals.

For others, they can use Larry or an expert named True Ott, PhD. True Ott can be reached at:  
[Mother Earth Minerals](#)

### Objective #16: Deal With Tumors

Tumors that can kill a patient, by themselves, are considered “dangerous” tumors. I have already linked to the article on treating dangerous tumors and how to make sure they do not come back:  
[Article on Treating Dangerous Tumors](#)

While many treatments will always shrink tumors, such as the highly alkaline protocols, getting rid of tumors completely is very challenging.

In cases where tumor size is important, such as a tumor is pressing on the bile duct, surgery may be necessary. While some alternative cancer treatments can shrink tumors, it is usually a slow process.

Tumors can be deadly even when they are in non-vital parts of the body, such as with breast cancer. They can be like a salesman who just doesn't go away and keeps coming back and brings other salesmen with him.

The ICRF is well aware of the issue of tumors and is constantly looking for better ways to get rid of them for good. It was this research that resulted in our emphasis on getting rid of the microbes in the liver and lymph system.

While herbs from the “[Herb Healers](#)” website can totally obliterate surface tumors or tumors just below the surface, in some cases the “hole” left where the tumor was is very unsightly and may be unacceptable to some people (but the patient may survive because of the treatment).

Even the DMSO and baking soda protocol can leave scarring. Scarring is not so bad, but the protocol only works on surface tumors.

See this article for more information about shrinking tumors, but I can tell you this is a major research topic of the ICRF:

[How to Shrink Tumors](#)

### Objective #17: Deal With The Patient's Mental Attitude

The mental attitude of the cancer patient is critical. A poor mental attitude of a cancer patient can significantly reduce their chance of survival because they do not have the will to live. The family and friends must always be positive in what they say. They should always encourage the patient, without being superficial in their encouragement.

Do not underestimate the importance of the mental attitude of the patient. The family and friends must constantly be aware of this issue.

### Objective #18: Build the Immune System

Building the immune system is the last of the priorities, not because it isn't important, rather because it takes so long to accomplish. Many cancer patients who seek out natural cancer treatments have been sent home to die by orthodox medicine and these patients frequently don't have the time (left to live) to build their immune system, thus they should focus on quicker-starting protocols.

So why is this item on the list at all? The reason is this: because it takes a long time to build the immune system, the sooner you start, the sooner the immune system will be made strong and will contribute to helping the patient.

To prevent regression (i.e. to prevent cancer from coming back), building the immune system is the #1 priority, so eventually, the patient will need to take immune builders.

Among the things to build the immune system are the [Bob Beck Protocol](#) and several very powerful nutritional supplements. Some

of the electromedicine devices, such as the High RF Frequency Generator devices, almost act like a Bob Beck Protocol, but it still can help to use the official Bob Beck Protocol to clean the blood of microbes (which Bob Beck demonstrated supercharges the immune system).

There are many very good nutritional immune builders which are discussed throughout this web site. While getting rid of microbes in the organs and in the bloodstream will strengthen the immune system, supplements will give the immune system the nutrients it needs to become stronger. Here are some examples:

- ❑ [#1 Priority for Cancer Patients] Transfer Point Beta 1,3D Glucan or “Beta-1, 3-D Glucan”  
([www.betterwayhealth.com](http://www.betterwayhealth.com))
- ❑ Immutol
- ❑ MGN3 / MGN-3 or BioBran (due to FDA persecution, the name of this product changes from time to time)
- ❑ ModuCare (a sterols and sterolins supplement)
- ❑ An AHCC Supplement: Immpower, ImmunoKinoko, Immune-Assist includes AHCC
- ❑ Immune Fx

### Comments on the Objectives

Treating cancer is literally a race. It is a race to see whether cancer will kill the patient before the treatment is strong enough to stop the spreading of cancer and stop the damage done to the non-cancerous cells, etc. The cancer treatment must be stronger than the spreading of cancer. That is why a single treatment will never work.

Also, there should be some synergy in the protocols, meaning two of the treatments can make each other more effective. For example, the MSM/CS protocol and Bob Beck Protocol both kill microbes in the bloodstream.

Do you think they both should be used or only one of them should be used? Think about it for a moment.

These two protocols are more effective together than they are separate, meaning they are synergistic. When they are used together, they help each other quickly get past the key step of killing the microbes in the bloodstream to get to more important functions of the protocols.

All of this is exactly why we created a section called: “Complete Protocols.” The “Complete Protocols” (e.g. the Collect-Budwig protocol, the Cesium Chloride protocol, etc.) contain multiple highly effective cancer treatments. They are excellent examples of complete cancer treatment protocols. Or they can be used as examples of how to put together a synergistic protocol.

The “Supplemental Treatments” are individual treatments. Some of these “supplemental treatments” are part of the “Complete Protocols” and some are not. For example, the High RF Frequency Generator with plasma amplifier device is built into the Collect-Budwig and the Plasma-Beck “Complete Protocols.” It is not built into the Bill Henderson protocol, but it can (and probably should) be added to the Bill Henderson protocol, for example.

In rare cases, a “Supplemental Treatment” should not be added to a “Complete Protocol,” but generally they can be added. Warnings are provided for these cases, but generally, the problem is not dangerous, only that one protocol may make another protocol less effective.

However, it should be pointed out that two highly alkaline protocols should NOT be combined as this could create alkalosis.

The point to all of this is to “throw the book” at your cancer. For example, the Dirt Cheap Protocol (a “Complete Protocol”) includes at least 14 individual cancer treatments, each of which has cured cancer by itself.

This does not mean the Dirt Cheap Protocol is as strong as the Collect-Budwig protocol (it is not), for example, only that it contains several very good treatments. For advanced cancer patients, the Dirt Cheap Protocol may not be strong enough, but it may be all the patient can afford. There are several price levels among the “Complete Protocols.” (Note: Nothing is sold from this website, I just know the reality of the different budgets of cancer patients.)

In fact, the cost is frequently an issue. Many cancer patients have no money left after being on orthodox cancer treatments. That is why I designed some of the protocols that are literally dirt cheap (e.g. the Dirt Cheap Protocol is very inexpensive and the Grape Cure is free because it replaces the normal foods a person eats). I even have an article on “Inexpensive Cancer Treatments”.

The Dirt Cheap Protocol is easily the most commonly used protocol on this website. This is not because it is the best protocol, but because it is the cheapest of the highly effective protocols.

Cost is also why we wrote the article: “How To Fund Your Alternative Cancer Treatment.” There are ways for advanced cancer patients to get the money they need for the stronger protocols without borrowing a dime and going into debt.

We are not going to downplay the importance of money. As I said, I don't sell anything, but I will tell you the most potent treatments can be very expensive. The most expensive single treatment that we typically recommend, for home treatments, is the High RF Frequency Generator with plasma amplifier, which cost about \$4,700.

But even nutritional protocols, which are used over a long period of time, can cumulatively cost as much as a High RF Frequency Generator. Examples are Collect and Fucoidan.

This is why I have spent so much time designing inexpensive protocols and trying to find things that people who live outside the United States can obtain locally. Many countries do not allow the import of things that cure cancer.

## Implementing the Priorities

Treating cancer can be compared to fighting a fire. In many cases you don't need a fire truck, but in some cases one or more fire trucks are required.

For those who are very advanced, and have only a short time to live, there are only three protocols that are strong enough and start working fast enough, to give these cancer patients real hope for survival:

- The [High RF Frequency Protocol](#)
- The [Collect-Budwig Protocol](#)
- The [Cesium Chloride Protocol](#)

These three protocols are in a league of their own when it comes to initial power and being fast-starting. The reason is that these protocols quickly protect the non-cancerous cells plus assist in creating a highly alkaline environment inside the cancer cells (not in the bloodstream). This very quickly slows down the spreading of the cancer. This fact has been known since the 1970s and probably before that.

For those who cannot afford one of the above protocols, the [Dirt Cheap Protocol](#) was especially designed to be very powerful, yet moderately inexpensive.

Another excellent, inexpensive protocol is the [Bill Henderson protocol](#).

For advanced cancer patients, it is the spreading of cancer that almost always kills them. It is generally not the cancer cells that kill a person, it is the damage done to “healthy” cells (because of the cancer cells) that kills them.

That is why the first priority in treating advanced cancer patients is to protect the non-cancerous cells with super-nutrients and stop the spreading of the cancer with alkalinity or oxygen.

Another very important concept has already been referred to: filling in the gaps in some of the protocols. For example, the Collect-Budwig is a superb alkaline protocol, but this author always recommends adding Fucoidan and the MSM/CS protocol in order to fill in a key gap in the Collect-Budwig. That “gap” is to go right after the cancer cells directly rather than waiting for the treatment to set up an alkaline environment.

As another example, the High RF Frequency Generator with plasma amplifier device, which will be discussed in a moment. While it is a stand-alone treatment for cancer, and it does start working very quickly, it cannot match the ability of alkalinity to slow down the spreading of cancer.

The reason the High RF Frequency Generator with plasma amplifier is an optional part of the Collect-Budwig protocol is that they are very complementary and synergistic treatments, meaning the two treatments combined are far better than either protocol by itself. The Collect-Budwig starts working very fast, but the High RF Frequency Generator with plasma amplifier does some things far better than the Collect-Budwig.

You use the Collect-Budwig to quickly slow down the spreading of the cancer plus you use the High RF Frequency Generator with plasma amplifier, Fucoidan and/or some other treatment, to directly attack the cancer cells or revert the cancer cells into normal cells.

Unfortunately, cesium chloride cannot be used in all cases with some electromedicine protocols because most electromedicine protocols will neutralize the way cesium chloride works.

Many cancer patients who are not that advanced do not need the kind of horsepower the best protocols provide, especially if they are newly diagnosed patients, do not have a fast-spreading type of cancer, they have not had very much chemotherapy and radiation, and do not have a particularly dangerous type of cancer. Many alternative cancer treatments can do very well for cancer patients who have at least six months to live (if they did nothing).

As they say: “if it works keep doing it.” But if it doesn't work you may need to add things to your protocol or switch to a more powerful protocol.

Alternative cancer treatments can be rated according to their “power” to deal with fast-spreading cancers, dangerous cancers or cancers that have already spread extensively.

As you might suspect, the High RF Frequency Protocol, the Collect-Budwig and the Cesium Chloride are the protocols to pick from for those with fast-spreading cancers or cancers that have already spread extensively. The alkalinity of these two protocols, at the cellular level, quickly helps slow down the spreading of the cancer.

In addition, because it may take several weeks to do the consultations and get the equipment a special article has been written so that you can start a powerful protocol TODAY. This is the What To Do Today article:

[What To Do Today](#)

---

**WARNING:** The Collect-Budwig protocol and Cesium Chloride protocol CANNOT be combined. There is too much overlap in

the way these protocols work to safely combine them. It is one or the other, but never both at the same time.

It is also important not to use more than one highly alkaline substance at a time. For example, baking soda should be stopped when cesium or Collect or another highly alkaline product is started.

---

If a tumor is in a dangerous location, and needs to be shrunk quickly, the High RF Frequency Protocol is the best choice. See the “Dangerous Tumors” article.

The Bob Beck Protocol, which is part of more than one of the “protocols,” is considered a long-range cancer treatment. It can take 2 or 3 months for the Bob Beck Protocol to really kick-in and even longer to supercharge the immune system. That is why the Bob Beck Protocol is never considered a “primary” cancer treatment. Nevertheless, it is an absolutely critical treatment to make sure the cancer does not return, as the “[Prevent Cancer From Coming Back](#)” article explains in great detail.

Let us briefly mention oxygen treatments. Oxygen treatments have enormous potential for treating cancer. (1) Unfortunately, the FDA also knows this and has shut down some of the most effective oxygen treatments, such as injecting ozone gas into a one-person sauna (where only the person's head is sticking out of the sauna enclosure).

[Hydrogen peroxide](#), which is a very famous treatment, is not as powerful as people are led to believe, but it certainly can be a supplemental treatment to any of the protocols.

The best recommendation we can give is called: H.B.O.T. or hyperbaric oxygen therapy. We recommend it for slowing down the spreading of cancer, but are not sure as to how effective it is as a treatment.

We recommend that anyone using standard chemotherapy take MSM just prior to using chemotherapy (see the article: "[If Still on Chemo or Radiation](#)").

There are many [natural, integrative cancer clinics](#) "south of the border" that we don't even know exist. They keep a very low profile and patients find out about them by "word-of-mouth." Some countries south of the border persecute natural medicine, some do not and others are unpredictable.

Some of the clinic treatments are very good, but some are not. We have an article on [clinics](#) which discuss some of the best clinics. Germany has the most famous clinics, and some of them are very good.

However, even if a person uses a top clinic they still need to study and use the concepts in the "[Prevent Cancer From Coming Back](#)" article.

"Regression" (i.e. the cancer "comes back" after it is cured) is a major problem in alternative medicine. The "[Prevent Cancer From Coming Back](#)" article discusses why it is an issue and how to make sure the cancer never comes back.

Another key element of a home protocol is telephone support by an expert who understands the action of the protocol. The Collect-Budwig protocol is supported by long-time cancer researcher Michael Vrentas. He will do a 2 hour coaching session for \$250. Mike has also produced five hours of audio CDs for download (\$29.95) and hard CD copies for \$39.95 mailed to you). Michael has also trained his daughter, Tiffany Redel to teach users of the protocol this vital information and to do in-depth consultations.

The Cesium Chloride Protocol is supported by [The Wolfe Clinic](#).

The [Bill Henderson protocol](#), designed by another long-time cancer researcher, is very inexpensive and very potent. It is supported by Bill's wife Terry Henderson for about \$250, and she

has a book written by Bill to go along with her “coaching” session instead of audio CDs.

The Oleander Protocol is supported by a Yahoo chat group which is monitored by several experts (oleander is not recommended for fast-spreading cancer or cancers that have already spread significantly). And so on.

Also, on this website there are special articles for special types of cancer. Many kinds of cancer have unique problems that need to be dealt with.

Also, review other articles, as you get time, which may apply to your situation (especially the “Special Situations” article, which is required reading).

---

### Other Keys to Survival

There is one key thing that even expert telephone support and money cannot provide; a “will to live” in the patient. A strong “will to live” by the cancer patient is just as important as any of the treatments.

Every cancer patient must do things to take their mind off of their cancer. This may include hobbies, reading or other activities. They must not just sit around and feel sorry for themselves; rather they must stay actively involved. For example, in one German cancer clinic they give art lessons to patients.

Strong support from family and/or friends is a key part of this. Family and friends must distract attention from the negative thoughts of having cancer. Negative attitudes among the family and friends are not an option.

In addition, negative attitudes about alternative cancer treatments in general are not an option. If someone bad-mouths the power of

Mother Nature, they should be invited to keep their mouth shut about the subject and quit watching so many doctor shows on television (and have them read the “[14 Questions and Answers](#)” article or watch the [Burzynski](#) feature movie).

Finally, one of the absolutely key issues relative to surviving cancer is doing exactly what you are told and being fanatical about doing it. You will likely be working with an expert who knows what it takes for someone to survive cancer. There may be very little room for error in using the treatment. Using different brands, not following doses or using only some of the protocols, can lead to the failure of the treatment. There is little margin of error. Do what you are told to do and do it fanatically.

If you add things to the protocol, check with your consultant for conflicts. Never, never substitute brands or products. As already mentioned, there are about 100 “[Rife Machines](#)” found on the Internet. None of them even remotely matches the required specifications of either of the High RF Frequency Generator machines. However, a few of the Rife Machines have done well against cancer, but most are grossly underpowered or do not have the necessary frequency ranges.

---

### Objective #1: The Importance of “Buying Time”

The first thing an advanced cancer patient needs to do is “buy time.” What “buy time” means is that their “time to survive” is increased by several months so that the highly effective cancer treatments have more time to cure the cancer.

For example, if a person had an estimated two months to live, and a specific cancer treatment takes four to six months to cure them, the patient is in deep trouble. So a person might use [Fucoidan](#), [D-Ribose](#) and the high RF frequency generator machine (if they are already weak) to “buy time” to extend the date of death by several

months so that the main cancer treatment has enough time to work.

The “buy time” protocols may or may not get rid of cancer cells, but what they must do is provide energy and nutrients to the very weak non-cancerous cells and cancer cells.

Actually, there are many supplements, and another electromedicine device which outputs a wide range of wave forms (the Quantum Pulse or BioCharger), that need to be considered when thinking about “buying time.”

No matter what primary protocol a cancer patient is on, they need to consider adding additional products to their protocol specifically to “buy time.” Check with the support person of your main cancer treatment to verify the safety of adding any of these protocols to your treatment, especially if it is an alkaline protocol.

Here is a list of some of the best protocols to “buy time” (all doses are for adults):

1) Electromedicine: The High RF Frequency Generator, by far the best way to energize cells for weak cancer patients, in fact nothing else even comes close. By energizing cells, creating massive amounts of nitric oxide, etc., this device essentially extends life indefinitely in many cases. It makes the actual curing of the cancer much easier because it does much of the work.

#### High RF Frequency Protocol

2) Electromedicine: the Quantum Pulse (formerly the Vibe machine), costs about \$19,000. For those who cannot afford either, try to find someone who already has a Quantum Pulse who lives near them. This is another superb way to quickly energize cells in the body to “buy time.” See:

The Quantum Pulse to find a location near you.

Note: Both the high RF frequency generator and the Quantum Pulse use a technology invented by Nichola Tesla, who was another super-genius who got involved in health issues and who has been totally ignored by orthodox medicine. Either one of these two devices are required if you can buy or find them.

A device that costs about half of a Quantum Pulse, and may be just as good or better, is the BioCharger.

3) H.B.O.T. (Hyperbaric Oxygen Therapy) is another expensive device that most people will not purchase, although there are now single-person H.B.O.T. devices that are not too expensive. This device pushes an enormous amount of oxygen into the blood. This not only kills microbes in the bloodstream but can greatly energize the non-cancerous cells and “buy time.”

There are many other oxygen devices which might also be effective at “buying time.”

4) Fucoidan, the dose is 1/2 bottle a day for adults (the bottle is actually one liter, which is about 33 ounces), but the person must “build-up” to the 16 ounce dose over 4 days: 4, 8, 12, 16 ounces. This is one of the key products to “buy time.”

While technically Fucoidan may not physically shrink tumors quickly, within two weeks it can “relax” the tumors so they are not pressing hard on some part of the body (such as a nerve).

*Every day the Fucoidan is taken the daily dose must be spread out into several small doses.*

No matter what your first primary protocol is, if the patient is advanced, it is critical to use Fucoidan because of its ability to “buy time” for any protocol.

5) Eniva Vibe (in the orange bottle) is a superb mineral supplement to energize cells. You should not use this protocol with the Collect-Budwig protocol, but it can be used with any

other protocol. The dose is to build up to 6 TABLEspoons a day, two in the morning, two at noon and two at night. This is very close to being a required treatment! Use Google to find a vendor.

6) Juice Plus is a superb vitamin and mineral supplement. By itself, cancer patients have survived their cancer when using only this product. I am not allowed by the manufacturer (because I make medical claims) to link to a vendor of this product, but I will say it is very close to being a required product. Use Google.

7) The MSM/CS or MSM/LIPH protocol (can help pain very quickly). MSM is Methyl Sulfonyl Methane, which is an incredible molecule needed by cancer patients, partly because it can deal with lactic acid (which all cancer patients have). But it also helps get microbe-killing molecules (e.g. colloidal silver or LIPH) *inside the cancer cells* to kill the microbes inside the cancer cells (which allows the cancer cells to revert into normal cells).

This protocol is REQUIRED for melanoma, sarcomas, squamous cell carcinoma and uterine cancer because of the way these types of cancer spread.

8) The Brandt Grape Cure is a protocol which uses only pesticide-free purple grapes. Purple grapes contain about a dozen nutrients that kill cancer cells. It also can energize cancer cells and non-cancerous cells. If you can get pesticide-free purple grapes, this is a 30-day protocol to consider. A limited number of supplements (plus any oxygen protocol) can be used to supercharge this protocol. For the complete protocol see the Brandt Grape Cure article.

9) Liph, a homeopathic protocol, and generally used with MSM (see above) is very good at “buying time,” and only costs about \$1 a day. We have had some impressive testimonials of people using this protocol by itself.

## Objective #2: Cachexia, Patients Who are Weak, etc.

Every cancer patient in the world, by definition, has lactic acid in their blood. In other words, they have some level of cachexia. The major symptom of cachexia is a general weakness of the patient. However, other things can also cause weakness, such as by killing too many microbes in the bloodstream too quickly or by killing too many cancer cells too quickly or a strong detoxification. These things can create a huge burden on the liver which may require coffee enemas.

Cachexia is caused by the following cycle:

Cancer cells consume huge amounts of glucose and they create lactic acid and put the lactic acid into the bloodstream and it goes to the liver,

The liver converts the lactic acid into glucose and releases it into the bloodstream where it goes back to the cancer cells.

This cycle is repeated over and over again as the liver converts lactic acid into glucose and the cancer cells convert glucose into lactic acid. Cancer cells consume 15 times more glucose than other cells.

The problem with this ping-pong game (or technically a “cycle”), is that huge amounts of energy are consumed by this cycle. The non-cancerous cells are not only starved of glucose because cancer cells consume huge amounts of available glucose, but also because lactic acid prevents many nutrients from getting to the non-cancerous cells!

The lactic acid cycle is estimated to kill about 40 percent of all cancer patients.

The theoretically best treatment for cachexia is a product called: Hydrazine Sulfate.

However, this product is difficult to work with because there is a long list of substances which are dangerous if used with Hydrazine Sulfate. For example, H.S. could never be used with Collect because of all the amino acids in Collect.

Here is more information about Hydrazine Sulfate. Patients with advanced cachexia should strongly consider taking H.S.

There are other options to deal with cachexia. First, when you get rid of the cancer cells no more lactic acid will be produced. Thus, protocols which can quickly kill cancer cells (or revert them into normal cells) can help deal with cachexia.

But there are also other things than can help get glucose into non-cancerous cells or help the cells to create their own energy.

Here is a list of things for people who may have light to moderate cachexia (if they do not want to use H.S.):

1) D-Ribose (Required Treatment #1) which can get energy into the cells even in the presence of lactic acid. The standard dose is 5 grams, three times a day, for a total of 15 grams a day.

2) MSM (Required Treatment #2), mentioned above, which is part of the MSM/CS protocol but can be used by itself. Because the MSM can be hard on the stomach, the patient should take a few days to build up to 10 to 20 grams a day.

MSM (see the MSM/CS protocol for instructions), or the MSM/LIPH, MSM/CD (chlorine dioxide) or the MSM/D3 are required for weak cancer patients. Most likely they are weak because of cachexia and MSM is needed to deal with lactic acid (which is what causes cachexia). MSM can help flush the lactic acid out of the body in more than one way.

3) Vitamin C can also help energize cells in the presence of lactic acid. The maximum oral safe dose is 10 grams a day. Do NOT use pure potassium ascorbate; use a mixture which has only a small

amount of potassium ascorbate. Build-up over a few days. The maximum dose should be spread out during the day into several small doses. This vitamin cannot be used with the Budwig Diet, which is part of the Collect-Budwig.

4) Pickle Juice is used by athletes to prevent cramps. It is superb at getting energy to cells and works very quickly.

5) CoQ10 or CoEnzyme Q10 (a well known supplement – 1,200 mg a day).

---

## Understanding Electromedicine

While most people understand the importance of diet and nutrients in treating cancer, they are clueless about what “electromedicine” is in alternative medicine.

As already mentioned, do not confuse the very gentle electromedicine protocols of alternative medicine with the barbaric treatments of orthodox radiation therapy. Typically, a person will not even feel that the electromedicine device is turned on. Talk about gentle!

If you read the “What Causes Cancer” article you know that cancer is caused by microbes which are *inside* the cancer cells. If you kill all of the microbes inside the cancer cells, the cancer cells will revert into normal cells.

Electromedicine protocols are designed to kill microbes. Depending on the device, they can kill the microbes inside the cancer cells or they can kill microbes in the bloodstream and lymph system.

The High RF Frequency Generator with plasma amplifier and High RF Frequency Generator with linear amplifier are patterned after the “Rife Machines” of the 1930s and 1940s, which were

build by Dr. Royal Rife. But the new devices use modern technology and can do a lot more things.

The High RF Frequency Generator with plasma amplifier is like a small radio tower. The person sits or lays next to it. The High RF Frequency Generator with linear amplifier uses four electrodes and creates four electrical currents. The High RF Frequency Generator with plasma amplifier is the more powerful of the two, but the 15-watt linear amplifier can be used in many cases, particularly for cancers below the neck which are not fast-spreading or particularly dangerous (e.g. a slow-growing liver cancer).

An electromedicine device in alternative medicine is generally a device that creates one or more gentle electrical currents or broadcasts an electromagnetic field either continuously or in pulses. These currents or fields are designed specifically to kill microbes which are inside of the cancer cells (that is why they have a “carrier wave”). This allows the cancer cells to safely revert into normal cells.

**WARNING:** There are many electromedicine devices for sale on the Internet. Many of them claim to be “Rife Machines.” Some of these devices were designed before actual, original Rife Machines (from the 1930s) were found. Only two “Rife Machines” (usually called: “frequency generators”) even come close to meeting the specifications of the *original* Rife Machines. These are the High RF Frequency Generator with plasma amplifier and the High RF Frequency Generator with linear amplifier. No other “Rife Machine” even comes close to meeting the specifications and authenticity of these two electromedicine devices. While a few of the other brands of “Rife Machines” have done well treating cancer, the High RF Frequency Generator models that we recommend are the only authentic true “Rife Machines.

To view the photos and full specifications of the High RF Frequency Generator with plasma amplifier go to our vendor's website at: [www.FrequencyStore.com](http://www.FrequencyStore.com)

---

There is no way that an electromedicine protocol can differentiate between a cancer cell and a normal cell so electromedicine protocols will never be able to kill cancer cells directly (without using tricks to let the electrical field target cancer cells). But in a sense they are more effective than killing cancer cells because reverting cancer cells into normal cells is far less dangerous to the body because there is no debris from dead cancer cells.

The three key “electromedicine” devices are (starting with the most expensive):

High RF Frequency Generator with plasma (broadcast) amplifier (designed to revert cancer cells into normal cells) – about \$4,700,

High RF Frequency Generator with linear amplifier (the “little brother” of the plasma amplifier, which uses electrodes and electrical currents, is also designed to revert cancer cells into normal cells) – about \$2,500,

Bob Beck Protocol (this is not a “Rife Machine,” it is designed using an entirely different technology to remove all microbes from the body and supercharge the immune system and the immune system then kills the cancer cells) – about \$1,300 although most of the pieces of this protocol can be made at home for virtually nothing.

It should be clearly understood that if a person cannot afford both a nutritional protocol and an electromedicine protocol that the nutritional protocol should take priority. Using alkalinity to stop the spread of cancer and using nutrients to protect the non-cancerous cells is more time-critical than what electromedicine devices do.

As a direct cancer treatment, if you cannot afford the High RF Frequency Generator with plasma amplifier, then you can use the less expensive High RF Frequency Generator with 15-watt linear

amplifier. If you cannot afford the High RF Frequency Generator with linear amplifier, then you can use the Bob Beck Protocol. As mentioned, most of the Bob Beck equipment can be made at home by someone who can build a device from a simple electrical circuit.

---

## The Eternal Debate Between Pasteur and Beauchamp

The Pasteur/Beauchamp debate goes something like this: Pasteur discovered that most diseases were caused by microbes. He was right.

Then Beauchamp came along and said that if you create the correct “inner terrain” in the body (e.g. by using an alkaline diet), the microbe issue of Pasteur becomes irrelevant because you will be healthy. The supporters of Beauchamp claim that he was far superior to Pasteur.

The debate is nonsense because what Beauchamp really proved is that Pasteur was right. Beauchamp just figured out a way to deal with the problem.

Microbes do cause most major diseases, including cancer. If you do not understand how microbes cause cancer you did not read the “What Causes Cancer” article. With cancer, the key microbes are *inside* of the cancer cells, though other microbes in the body can weaken the immune system.

With regards to cancer, if a person has a highly alkaline diet, and avoids most “junk foods” they are not likely to get cancer. And if they already have cancer, every believable cancer treatment on earth is going to recommend an alkaline diet.

Acidic diets “feed the cancer.” Actually, an acidic diet feeds or excites the microbes which are inside the cancer cells which can

force the cancer cells to divide more rapidly. Sugar and dairy products are the two worst foods on earth for a cancer patient.

---

Dr. Bob Beck, PhD and Royal R. Rife Leapfrogs Beauchamp

The problem with Beauchamp is that his theory will likely not get rid of the microbes! While the microbes inside the cancer cells are inert and lethargic, they are still there.

Why is this important?

Dr. Bob Beck, a PhD in physics, figured out that if you get rid of all of the microbes in the bloodstream, all two pounds of them, the immune system will be supercharged. The bad news is that this is a very slow process.

Royal R. Rife also proved that if you can kill the microbes in the organs (and perhaps colon) that you can also supercharge the immune system!

This cannot be emphasized enough because when the immune system is supercharged the immune system will take care of the cancer.

Thus, the Beauchamp approach, while it is a good tactic, falls far short of what happens when the microbes in the organs are totally eliminated from the body as opposed to just making them lethargic.

While the Bob Beck protocol eliminates the microbes in the bloodstream, this process works far too slowly to be considered a “major” cancer treatment.

However, because the High RF Frequency Protocol goes directly after the microbes and parasites in the organs it is considered a “major” cancer treatment.

So the Bob Beck and especially the High RF Frequency Protocol discoveries turn out to be a giant leap forward from Beauchamp because with Beauchamp, *the immune system is just as lethargic as the microbes*. The patient is alive, but they are not “healthy.”

But we can take even another giant step forward.

In summary, the Rife protocols (High Rf Frequency) work much faster than the Beck protocol, so the Rife protocol is generally started at the beginning of the treatment. The Beck protocol is more of a long-range super-protocol to supercharge the immune system and is usually not used for cancer but it is used for AIDS, Hepatitis C, etc.

---

### A Quick Overview

When thinking about priorities for advanced cancer patients, this snippet will give you an idea of where the Bob Beck falls:

——— (First, the super-fast working treatments) ———

- 1) Special electromedicine devices to energize cells (e.g. Quantum Pulse, High RF Frequency Protocol, etc.),
- 2) Alkalinity and/or oxygen to quickly slow down the spread of cancer (e.g. Celect-Budwig, Cesium Chloride, etc.),
- 3) Super-nutrients to energize the cells and keep the patient alive (e.g. Vibe Liquid, Juice Plus) and deal with cachexia/lactic acid (e.g. MSM/Vitamin C, D-Ribose, which get past the lactic acid blockade)

——— (Second, the medium-fast treatments) ———

- 4) Special cancer treatments that target cancer cells (e.g. MSM/CS, Fucoidan, etc.),

5) Electromedicine devices from Royal Rife research (e.g. High RF Frequency Generator instruments),

6) Super-nutrients to kill cancer cells (e.g. Brandt Grape Cure, Aloe Arborescens)

—— (Third, the slow-starting, but long-range treatments to prevent regression) ——

7) Nutrient protocols that build the immune system (e.g. Transfer Point Beta Glucan, IP6, RM-10, etc.),

8) Bob Beck devices to kill microbes in the bloodstream, which supercharges the immune system,

9) Hulda Clark Zappers (e.g. Croft “Terminator 2”) to kill microbes in the bloodstream and parasites in the stomach, etc. (though we don't know which brand is best at doing this).

Note that the fast-working protocols work on the cancer cells and damage to non-cancerous cells. The medium-range protocols work on the cancer cells and start the process of building the immune system. The long-range protocols are microbe-oriented and immune system oriented.

This list is ordered based on how fast these treatments can help advanced cancer patients. Building the immune system is a slow process so the four long-range immune-building protocols are mentioned last.

The Royal Rife protocol (e.g. the High RF Frequency Generator with plasma amplifier) is used long before the Bob Beck Protocol (e.g. the Plasma-Beck) both because it goes directly after the cancer cells (whereas the Beck protocol only builds the immune system) and thus it helps the cancer patient much quicker.

Also, if pain is an issue, both alkaline and electromedicine protocols can deal with pain almost immediately. However, special

pain protocols exist to deal quickly with pain. See the “[Cancer Pain](#)” article.

The important thing to remember is that the quick protocols are cancer-cell and energy focused. The long-term protocols are microbe focused, meaning immune system focused.

See the “[Prevent Cancer From Coming Back](#)” article for what to do after the cancer is under control and the patient is in remission.

The Gerson Therapy was one of the first natural cancer therapeutics and has successfully treated patients for more than 80 years. Rooted in an organic, plant-based diet, raw juices, coffee enemas, and natural supplements, the Gerson Therapy restores the body’s ability to heal itself.

[The Gerson diet](#) is naturally high in vitamins, minerals, enzymes, micro-nutrients, and extremely low in sodium, fats, and proteins. A typical daily diet for a Gerson patient on the full therapy regimen features 13 glasses of fresh, raw carrot-apple and green-leaf juices prepared hourly from fresh, organic fruits and vegetables; three full plant-based meals, freshly prepared from organically grown fruits, vegetables, and whole grains; and fresh fruit and vegetables available at all hours for snacking, in addition to the regular diet. [1]

Generally, a meal will include salad, cooked vegetables, baked potatoes, Hippocrates soup, and juice.

The Gerson Institute, a non-profit organization in San Diego, is dedicated to providing education and training in the Gerson

Therapy. The institute provides referrals to licensed clinics, practitioners, and home set-up trainers. There are two licensed Gerson clinics: the Gerson Clinic in Mexico and the Gerson Health Centre in Hungary.

The Gerson diet is extremely detailed. It is not just the foods that are included and excluded; it is when the foods are eaten, how often they are eaten, how they are prepared, how not to prepare them, what to cook them in, how to package them, etc.

Dr. Max Gerson was born in Wongrowitz, Germany, in 1881. He attended the universities of Breslau, Wuerzburg, Berlin, and Freiburg, and graduated in 1909.

With Germany in the grip of Adolph Hitler's Nazi regime, Dr. Gerson left the country for Vienna in 1933. He also lived for a short time in France and England. Arriving in the United States in 1936, Dr. Gerson was licensed to practice in the state of New York in '38 and became a U.S. citizen in 1942.

In 1946, Dr. Gerson appeared before the Pepper-Neely Congressional Subcommittee, during hearings on a bill to fund cancer treatment research:

[Case history of 10 cancer patients clinical observations theoretical considerations and summary](#)

In 1958, after 30 years of clinical experimentation, Dr. Gerson published *A Cancer Therapy: Results of 50 Cases* to detail his theories, treatment, and results.

Dr. Gerson was well aware of soil issues, the electricity of cells, how cancer cells ferment glucose, oxidizing enzymes, sodium/potassium balance, connective tissue, and other technical issues related to cancer. His treatment and approach were a “whole body” approach; he did not consider treating only the localized area of concentrated cancer cells — as orthodox medicine does — a good idea.

He was focused on treating the liver. Several chapters of his book deal with various aspects of the organ. Dr. Gerson saw a parallel between the deterioration of the liver and the growth and progression of cancer. Because of his concern for liver problems, he did not favor fasting.

Dr. Gerson also was interested in the potassium group of minerals versus the sodium group. He favored the potassium group for treating cancer and his diet forbids adding salt to foods. The ratio of potassium to sodium was something he emphasized several times.

Howard Straus, the grandson of Dr. Gerson, chronicles the trailblazer's life and development of his therapy in *Dr. Max Gerson: Healing the Hopeless*. The biography discusses the development of Dr. Gerson's dietary therapy and the struggles he faced in challenging orthodox medicine with a nutritional protocol.

Even in the 1950s, Dr. Gerson was aware of the importance of organic foods. General farming practices left the plants — such as carrots — without enough nutrients. Damage was done to foods by the way they were processed and packaged. Think how much worse things are today ...

*“Stay close to nature and her eternal laws will protect you.”*

— *Dr. Max Gerson*

Pepper-Neely Congressional Subcommittee

Modern medicine was hijacked in 1910, one year after Max Gerson graduated from the University of Freiburg, a public research university in Germany. [The Flexner Report](#) — officially known as Medical Education in the United States and Canada — was an attempt to align medical education under a set of norms that emphasized laboratory research and the patenting of

medicine. The report was funded by John Rockefeller and Andrew Carnegie, among others.

Rockefeller and Carnegie offered grants to the best medical schools in America — with a caveat: only an allopathic-based curriculum could be taught. Thus, Rockefeller and Carnegie systematically dismantled the courses of these schools by removing any mention of the natural healing power of herbs and plants, or of the importance of diet to health. The result is a system which churns out doctors who often are deficient in nutritional knowledge and disregard the idea that what you eat can actually heal or hurt you.

While physicians encourage patients to make healthy food choices, only 27 percent of U.S. medical schools actually offer students the recommended 25 hours of nutritional training, according to [a perspective piece](#) in the July 2015 issue of *Academic Medicine*. The word “nutrition” is not included in board examination requirements for internal medicine certification, and cardiology fellows do not need to complete a single requirement in nutrition counseling.

## Inside Knowledge

### Did You Know?

Claude Denson Pepper was a member of the Democratic Party. He represented Florida in the U.S. Senate from Nov. 4, 1936, to Jan. 3, 1951, and the Miami area in the U.S. House of Representatives from Jan. 3, 1963, until his death on May 30, 1989.

Matthew Mansfield Neely was a Democratic politician from West Virginia. He is the only West Virginian to serve in both houses of the U.S. Congress and as the Governor of West Virginia. He is also the only person to have held a full term in both Senate seats from the state.

But those same medical professionals believe they are fluent to address the Gerson diet and its effects on the body?

Dr. Gerson emigrated to the United States in 1936 and passed the medical board examination. Ten years later, he was front and center on Capitol Hill. Dr. Gerson appeared before the Subcommittee of the Committee on Foreign Relations of the U.S. Senate.

He addressed the Pepper-Neely subcommittee on behalf of S. 1875, a bill ostentatiously set forth to “authorize and request the President to undertake to mobilize at some convenient place in the United States an adequate number of the world’s outstanding experts, and coordinate and utilize their services in a supreme endeavor to discover a means of curing and preventing cancer.”

Dr. Gerson began his testimony with a recap of his background and his credentials — a member of the AMA, Medical Society of New York State, and Medical Society of New York County — and then addressed his approach to treating patients.

“The dietetic treatment, which has for many years been known as the ‘Gerson diet,’ was developed first to relieve my own severe migraine condition,” Dr. Gerson said. “Then it was successfully applied to patients with allergic conditions such as asthma as well as diseases of the intestinal tract and the liver pancreas apparatus. By chance, a patient with lupus vulgaris [skin tuberculosis] was cured following the use of the diet. After this success, the dietetic treatment was used in all other kinds of tuberculosis — bones, kidneys, eyes, lungs, and so forth.”

Dr. Gerson added that his first cancer patient (bile ducts) was treated in 1928 with success. Seven favorable cases followed out of 12 and remained free of symptoms up to 7½ years.

During testimony Dr. Gerson noted that his diet protocol is condensed into three components:

- The elimination of toxins and poisons and returning of the displaced “extracellular” Na-group, connected with toxins, poisons, edema, destructive inflammation, from the tissues, tumors, and organs where it does not belong, into the serum and tissues where it belongs — gall bladder with bile ducts. connective tissue, thyroid, stomach mucosa, kidney medulla, tumors, and so forth.
- Bringing back the lost “intracellular” K-group combined with vitamins, enzymes, ferments, sugar, and so forth, into the tissues and organs where it belongs — liver, muscles. heart, brain, kidney cortex, and so forth. On this basis, iodine, ineffective before, is made effective, continuously added in new amounts.
- Restoring the differentiation, tonus, tension, oxidation, and so forth, by activated iodine, where there were before growing tumors and metastases with de-differentiation, loss of tension, oxidation, loss of resistance, and healing power.

“The great number of chronic diseases which responded to the dietetic treatment showed clearly that the human body lost part of its resistance and healing power, as He left the way of natural nutrition for generations,” Dr. Gerson surmised.

Dr. Max Gerson’s testimony to the Pepper-Neely Subcommittee

Today, the National Cancer Institute contends Gerson Therapy is “advocated by its supporters as a method of treating cancer patients based on changes in diet and nutrient intake. An organic vegetarian diet plus nutritional and biological supplements, pancreatic enzymes, and coffee or other types of enemas are the main features of the Gerson therapy. The regimen is intended to “detoxify” the body while building up the immune system and raising the level of potassium in cells.” [2]

The NCI also notes, “the regimen is empirically based on observations made by Max Gerson, M.D., in his clinical practice and on his knowledge of research in cell biology at the time

(1930s–1950s). No results of laboratory or animal studies are reported in the scientific literature contained in the Medical Literature Analysis and Retrieval System Online database. Few clinical studies of the Gerson therapy are found in the medical literature.”

But that is only part of the story ...

*“I see in him one of the most eminent geniuses in the history of medicine.”*  
— Dr. Albert Schweitzer

Maybe it was a coincidence

While speaking to the Pepper-Neely subcommittee in 1946, Dr. Gerson contended, “The fundamental damage starts with the use of artificial fertilizer for vegetables and fruits as well as for fodder. Thus the chemically transformed vegetarian and meat nourishment, increasing through generations, transforms the organs and functions of the human body in the wrong direction.”

Conversely, Dr. Charles Thomas was named to Monsanto’s board of directors in 1942 and became a vice president the next year. By 1947 he was executive vice president. Dr. Thomas became president in 1950 and was named the chairman of the board in ‘60. He retired in 1970. It was this 30-year stretch of growth for Monsanto that laid the groundwork for today’s leading biotech behemoth.

□ History of Monsanto: What’s past is prologue

Consider this: Between the pharmaceutical industry — buoyed by the Flexner Report and backed by the deep pockets of John Rockefeller and Andrew Carnegie — and the agri-biotech industry — led by Monsanto — it’s not hard to surmise Dr. Gerson’s opinions were stomping on some mighty big toes. He even wrote in *A Cancer Therapy*, “Our modern agriculture decreased potassium

and iodine in our nutrition, precisely the minerals essential for prevention of cancer.”

## Inside Knowledge

### Did You Know?

During the 1920s, Raymond Gram Swing migrated to radio, a burgeoning platform for journalists. After covering the 1932 presidential election, he was offered a job at CBS. Swing turned down the job and it was given to Edward R. Murrow. During the early 1950s, the now-legendary Murrow hired Swing to write news copy for him.

When the Congressional Subcommittee concluded its work on July 2, 1946, Sen. Pepper recognized Raymond Gram Swing, “one of our distinguished radio commentators in this country.” Swing said, “I think this bill is one of the most encouraging expressions of intelligent democracy. I hope that it gets the full approval of Congress. It has an inspired work to do, and I want to say in particular that before I came here today I have seen some of the cancer patients of Dr. Gerson, and I believe that research along these lines is so necessary and so hopeful that I am delighted that you, Senator, have had the heart and the courage to bring the doctor here, and some of his patients; and I thank you for it.”

The next day, Swing addressed the Pepper-Neely hearing on his ABC radio broadcast:

*“Let me first say that I well appreciate that one of the basic virtues of the modern medical profession is its conservatism. For without the most scrupulous conservatism in the statement and application of medical knowledge, there can be no confidence in the integrity of medical science. But for the very reason that the practice of medicine must be conservative, medical science must be bold and unceasingly challenging. Otherwise, medical science will not progress as it can and must, and will lose its integrity.”*

*“A bill is before Congress, the Pepper-Neely bill, to appropriate a hundred million dollars for cancer research under Federal control. It proposes that the government go in for cancer research with something like the zeal and bigness with which it went for the release of atomic energy, turning the job over to the scientists with resources generous enough to solve the problem.*

*“This alone would make a good theme for a broadcast, just as an example of the use a great democracy can make of its intelligence and wealth. But the subject has been made peculiarly gripping by unprecedented happenings yesterday before the subcommittee which is holding hearings on this bill, and of which Senator Pepper is chairman.*

*“He invited as a witness a refugee scientist, now a resident of New York, Dr. Max Gerson, and Dr. Gerson placed on the stand, in quick succession, five patients. They were chosen to represent the principle prevailing types of cancer, and in each instance, they showed that the Gerson treatment had demonstrated what is conservatively called ‘favorable effect on the course of the disease.’ That in itself is remarkable, but it is all the more so because Dr. Gerson’s treatment consists mainly of a diet which he has evolved after a lifetime of research and experimentation. To say that Dr. Gerson has been curing cancer by a dietary treatment is medically impermissible, for the reason that there must be five years without [a] recurrence before such a statement is allowed. Dr. Gerson has cured tuberculosis and other illnesses with his diet, but he has only been working on cancer for four and a half years.*

*“Let me say right away that I am not discussing this Gerson diet as a cancer cure-all. It has produced remarkable results. It also has the failures in its records, which anything as yet unperfected is bound to show. It is not something that offers release from the most rigorous and conservative medical observance in its acceptance and application. Whenever something new and promising comes up in medicine, the temptation of the outsider and even some physicians is to run to glowing superlatives and expect too much from it. But anything that offers even a possibility of treating successfully at least some of the four hundred thousand existing cancer cases in this country is stirring news, no matter how conservatively it is formulated.*

*“There would be no Pepper-Neely bill to appropriate a hundred million dollars for cancer research if the existing research were coping with the need.”*

Less than two weeks later, Swing was out of a job. Politics — not the kind on Capitol Hill but the even seedier corporate greed of pay-for-play politics — were his undoing.

According to Dr. Gerson's daughter, Charlotte, "The executive directors of pharmaceutical companies producing cytotoxic agents for cancer treatment — members of the PMA [Pharmaceutical Manufacturers Association] — threatened to cancel all radio advertising contracts for their drugs sold over the counter, an annual loss in revenue for ABC amounting to tens of millions of dollars." [3]

It begs the question: What happened to the Senate's 277-page Pepper-Neely anticancer bill of 1946 (Document No. 89471)? Augustus E. Giegengack, the Public Printer as head of the then-Government Printing Office, boxed up and stored the paperwork. No copies of the report were distributed to the press. Few medical journals have even attempted to follow up on Dr. Gerson's testimony. Document No. 89471 now resides in the bowels of the Government Publishing Office with little hope of seeing the light of day.

Dr. Gerson died on March 8, 1959. "My father, aged 78, was in perfectly good health when, from one day to the next, he felt awful. They tested his blood and found a high level of arsenic," Charlotte Gerson said. The family did not notify the police. "We had our suspicions," she said, "but knew from experience that justice would not be done."

*"While writing the story of Gerson, I couldn't help feeling it was too shocking to believe."*

— S.J. Haught

Like father, like daughter

When Dr. Gerson died in 1959, Charlotte vowed his work would not die with him. She has continued Dr. Gerson's work through the Gerson Clinic in Mexico and the Gerson Health Centre in Hungary. In 1977 she founded the Gerson Institute with Norman Fritz, president of the Cancer Control Society. The Gerson Institute established treatment centers and trained holistic physicians, nurses, and kitchen help in the facets of Dr. Gerson's treatment.

Dr. Gerson's research showed that degenerative and chronic diseases are caused by toxicity and nutritional deficiency. Toxicity is accumulated from the pollution in the food, water, air and numerous chemical substances absorbed from your environment. Deficiency is the result of a diet that consists of artificially raised, chemically treated, processed and flavored foods. After a lifetime of chemical accumulation and low nutritional support, your body's defenses break down and the result is the manifestation of "chronic" disease.

According to the Gerson Institute, toxicity results from the "better living through chemistry" philosophy of our modern world, where

...

- Bug killer, weed killer, and chemical fertilizers are sprayed onto the plants we eat.
- Pollution is pumped into the air we breathe.
- Chemicals of all kinds are dumped into our oceans, lakes and water supplies.
- People are fed hazardous Fluoride waste under the pretense of being good for their teeth.
- Farm animals are given growth hormones so they produce a greater profit and antibiotics so they can survive their harsh lives.
- Pre-made Industrial foods are filled with chemicals that enhance taste so that you will buy more and turn off the "I'm full" switch in your brain so that you will eat more.
- Preserve and extend shelf life so their "merchandise" will survive longer on the shelf.

- Drugs are given for every ill, pain and strain.
- Soaps, shampoos, deodorants and almost all personal hygiene and cosmetic products contain degreasers, alcohols, parabens, fragrances, stabilizers, solvents and numerous other chemicals.

Nutritional deficiency comes from eating nutritionally depleted, genetically engineered, pesticide laden, salted and sugared foods, loaded with preservatives, dyes, artificial flavors, sweeteners, and thousands of chemicals.

The process of restoring your natural defenses and rebooting your immune system is simple:

- Drink flavorful organic juices throughout each day. The prescribed Gerson juices, made from organic fruits and vegetables, bathe your 100 trillion living cells in a constant stream of health-giving vitamins, minerals, nutrients, and enzymes.
- Follow an organic plant-based diet, with lots of raw and cooked foods. This floods your body with more vitamins, minerals, nutrients along with the critical health promoting enzymes necessary to repair your body.
- Detoxify your body at the cellular level using a powerful natural process that flushes chemicals and toxins from the liver.
- Prevent depletion of your organs and interruption of critical biological processes by eliminating industrial foods with chemicals, preservatives, dyes and additives, animal protein, alcohol, smoking, drugs, sugars, salts, fats, oils, dairy products, fluoride, chlorine.
- Eliminate further poisoning of your body by removing the sources of chemicals and toxins in your environment such as household cleaners, fabric softeners, non-organic soaps and shampoos, perfumes and deodorants, and air fresheners.

One of the main benefits of the Gerson Therapy is its rapid elevation of the pH, or alkalinity, of the body. Cancer cannot survive an alkaline environment, and the proteolytic (protein-digesting) pancreatic enzymes that normally keep cancer in check are reactivated in an alkaline environment. Additionally, the red blood cells that supply every one of our cells lose their ability to carry oxygen at low pH (acidic) values. When the vegan diet raises the pH of the blood stream, disease processes become disabled while the body's immune system, deactivated by an acidic environment, begins to become active again, attacking the disease-causing organisms. [4]

In April 2007, Alex Molassiotis, Ph.D., of the Hong Kong Polytechnic University, wrote, "A considerable number of patients with cancer have used or are using the Gerson Therapy, an alleged anticancer metabolic diet. However, there is almost no scientific support for this regimen. Hence, the present case review study of six patients with metastatic cancer who used the Gerson Therapy aims at critically evaluating each case to derive some valid interpretations of its potential effect.

"All six cases had a cancer diagnosis with poor prognosis. Despite the presence of some confounding variables, it seems that the Gerson regimen has supported patients to some extent both physically and psychologically. More scientific attention needs to be directed to this area so that patients can practice safe and appropriate therapies that are based on evidence rather than anecdotes.

"Although the effectiveness of the Gerson regimen has not been rigorously proved, equally it has not been disproved either. ... A definitive trial on the efficacy of the Gerson regimen is long overdue. Information from such a trial would be of great value as it would assist patients to make informed decisions, protect their safety, and add to the patients' choices in improving their survival chances and quality of life in their fight against cancer."

Surviving against all odds: Analysis of 6 case studies of patients with cancer who followed the Gerson Therapy

The National Cancer Institute notes that in 1990, a study of a diet regimen similar to the Gerson Therapy was done in Austria. The patients received standard treatment along with the special diet. The authors of the study reported that the diet appeared to help patients live longer than usual and have fewer side effects. The authors said it needed further study. In 1995, the Gerson Research Organization did a retrospective study of their melanoma patients who were treated with the Gerson Therapy. The study reported that patients who had Stage III or Stage IV melanoma lived longer than usual for patients with these stages of melanoma.

And yet, there have been no clinical trials that support the findings of these studies. Clearly, this begs the question: Why? The short answer: Drug companies are not interested in medicines that cannot be patented — and nature cannot be patented. Big Pharma knew this in 1946 when Dr. Gerson appeared before the Pepper-Neely subcommittee, and it holds true more than 70 years later.

However, there have been curricular suggestions for U.S. medical schools, including:

- Teach holistically — Students should be required to take courses in nutrition exercise, stress management, and sleep hygiene.
- Test for nutritional knowledge — Med schools should consider competency examinations that cover factual knowledge and students' ability to give sound advice on nutrition and wellness. These classes can operate as prerequisites for professional certification.
- Use teaching kitchens as laboratories — Can combining anatomy with culinary lessons actually teach students about the dietary impact of foods? This question has been the impetus for medical schools across the country that are taking students from the classroom to the kitchen for a taste of experiential learning.

If they get busy now, they only have about a century of work to catch up on Dr. Gerson ...

*“They have more money, they lobbied more, and got the law passed in their favor.”*

— *Dr. Richard Schulze*

## The Gerson Therapy Protocol

It is recommended that anyone using the Gerson Therapy Protocol combine it with the Collect-Budwig Protocol. Mike Vrentas, who supports those on the Collect-Budwig Protocol, is an expert on Gerson. Thus, Vrentas can support a patient on the Collect-Budwig Protocol and [the Gerson diet](#) can be used as the “cancer diet” when using the Collect-Budwig Protocol.

However, there is a warning: A person should not use too many highly alkaline protocols. A person needs to work with Vrentas — let him know you are using the Gerson diet as the “cancer diet” — to get the best and safest combination of these two protocols. Do not add the Kelmun baking soda protocol, or any other highly alkaline protocol, to the Gerson protocol.

### □ [Collect-Budwig Protocol](#)

Gerson Therapy is a metabolic therapy, using a special diet, plus supplements and a coffee enema, to fight cancer. A high percentage — 90 to 95 percent — of Dr. Gerson’s cancer cases were terminal, and overall his cure rate was about 50 percent. That number is exceptional; he counted all of his patients — not just those who lived for a year or more. This percentage is far higher than current day orthodox treatments and higher than most alternative cancer treatments.

Dr. Gerson noted, “this percentage could be higher if there were better cooperation from the family physician, the patient himself and less resistance from the family against such a strict regime.” He also is known for his high cure rate of tuberculosis, which is caused by a bacteria.

*“The ideal task of cancer therapy is to restore the function of the oxidizing systems in the entire organism. This, of course, is difficult to accomplish. It involves the following: 1) detoxification of the whole body, 2) providing the essential mineral contents of the potassium group, 3) adding oxidizing enzymes continuously as long as they are not reactivated and built in the body (in the*

*form of green leaf juice and fresh calf's liver juice). This will create a near normal condition of the oxidizing system in the body, to which malignant cells with the fermentation system cannot adapt."*

— Dr. Max Gerson, *A Cancer Therapy*

Dr. Gerson also was aware of the electrical component of cancer: "All investigators found that malignant tumors are characterized by a considerable electronegativity in the tissues and fluids." In fact, this is one reason why he was so interested in potassium and other minerals. "The late G.W. Crile, and his collaborators, M. Telkes and A.F. Rowland, found a decreased electrical polarization and an increased electric conductivity in malignant tumors which may be caused, in my opinion, by the greater sodium content in the growing part of the tumor," Dr. Gerson wrote in *A Cancer Therapy*.

One vitamin Gerson liked was niacin, and noted it *helps to bring back sufficient glycogen into the liver cells; open[s] the small arteries and capillaries; and raises the electrical potentials in the cells*. He also recommended discontinuing taking niacin in cases of bleeding.

Dr. Gerson was keen on iodine, a nutrient the Food and Drug Administration has made difficult to obtain in therapeutic quantities. "Iodine is a decisive factor in the normal differentiation of cells, and can be used in order to counteract the decrease of cell differentiation as seen in the cancerous tissues," he said. "Iodine is also regarded as counteracting some adrenal hormones."

As with several other alternative health practitioners (William Kelley, Hulda Clark, etc.) Dr. Gerson required a coffee enema. Generally, his enemas were given every four hours. However, in cases of discomfort (i.e. flare-ups), they were given every two hours. He noted a physician must monitor serum electrolytes frequently.

Dr. Gerson kept his cancer patients on his diet for at least 18 months, and frequently two years, to restore the liver as near as possible to normal.

The Gerson Institute has a complete breakdown of the diet, including videos and testimonials.

*“Any doctor in the U.S. who cures cancer using alternative methods will be destroyed.”*

— Gary Null

## To Gerson or not to Gerson

What are the Gerson Therapy merits? Keeping in mind that choosing a dietary and lifestyle protocol is highly specific to your situation, the Gerson Therapy may — or may not! — be right for you.

From the time you are diagnosed with cancer, you have a myriad of options. Your oncologist will explore these with you, and you may seek a natural-minded physician on top of that counsel. The location of cancer and stage will influence treatment options no matter who you go to. Other lifestyle factors like accessibility to natural healthcare professionals, budget, and how much assistance you’ll have will play into it as well.

Background also factors into your cancer treatment options. Certain things, like stopping smokeless tobacco when you have mouth cancer, are obvious. But it can go further than that. If you’ve got stomach cancer, dietary needs may be different than that for bone cancer.

## Charlotte Gerson

As you learn about and weigh protocol options, Gerson included, know that your options are not limited to your neighbor’s or

friend's options. Consider the evidence for and against it, and weigh what will be best for your situation.

Dr. Gerson developed his protocol on the premise that nutrient deficiency and toxic overload combined to create chronic and severe diseases, cancer included. These factors have only increased through the years, with both toxin exposure and cancer increasing in prevalence substantially since he began his studies.

In response, the Gerson protocol begins by completely eliminating sodium — a nutrient we have consumed in excess for years in processed, packaged, and canned foods — and bombards the body with organic fruits and vegetables, usually juiced, to the tune of 15-20 pounds every day. Supplements also are added.

Toxicity is a bit more challenging, as environmental pollutants are essentially impossible to completely eliminate. Rather than relying on avoidance only, Dr. Gerson hypothesized that the liver — our body's main detoxification organ — could be supported. His method utilizes a coffee enema, intended to stimulate the liver to expel toxins into the intestines and feces to be eliminated.

Little has changed in the Gerson protocol through the years, with practitioners and patients claiming great success in strict adherence. This, of course, requires a great deal of support from those around the patient, as well as a financial commitment. As with any protocol, it is intended to be observed without modifications or combination with another dietary regimen.

With more than 50 years of application, Gerson's website claims successful treatment of more than 50 severe illnesses. Dr. Gerson was not comfortable implementing his remedy until he had some solid experiential evidence, so their long track record of success has buoyed Gerson practitioners.

Formal evidence, however, is not as clear. A 2010 review in *Oncology* details the Gerson protocol, notes claims of 70-90 percent success rates, but also notes that formal case reviews have found

little to no scientific basis for Gerson therapy success. One of the studies reviewed had analyzed patients with pancreatic cancer. Some chose a protocol very similar to Gerson, and some chose chemotherapy — with chemotherapy patients actually faring better. [5]

The commitment involved in adherence to the Gerson protocol is intense — but most alternate remedies will be difficult. If you choose to amend your diet and supplements to pursue Dr. Gerson’s remedy, be sure you have a strong network of support around you, preferably with a trained holistic cancer practitioner. They can help you monitor your progress, keep you accountable, and advise you along the way.

Cancer protocol is as varied as the individuals they treat, and this could be the remedy that you need while your neighbor or friend needs something else. Working with a holistic professional can help you determine the path that’s right for you.

*“On two occasions Gerson became violently ill. Lab tests showed ... arsenic in his urine.”*  
— Norman Fritz

## Gerson on film

The question remains: “Why is this powerful curative therapy still suppressed, more than 75 years after it was clearly proven to cure degenerative disease?”

*The Gerson Miracle* was released in 2006. The film introduced Dr. Max Gerson who developed the Gerson Therapy more than 80 years ago. A proven remedy for cancer and most chronic and degenerative diseases, Gerson Therapy employs a diet and de-codification regimen to rebuild the immune system and restore the body’s own ability to heal itself.

Nine former patients talk about their successful recoveries from deadly cancers and Dr. Gerson's daughter, Charlotte, discusses opposition from the medical and pharmaceutical industries and why they fear an all-natural therapy that empowers people to take control of their health.

In 2006's *Dying to Have Known*, filmmaker Steve Kroschel set out to find hard evidence of the effectiveness of the Gerson Therapy. He traveled across the Atlantic and Pacific oceans, from upstate New York to San Diego to Alaska, from Japan and Holland to Spain and Mexico.

Kroschel presented the testimonies of patients, scientists, surgeons, and nutritionists who testified to the Gerson Therapy's efficacy in curing cancer and other degenerative diseases. He also presented scientific proof to back up their claims. Testimonies included a Japanese medical school professor who cured himself of liver cancer more than 20 years ago, a lymphoma patient who was diagnosed as terminal more than 50 years ago, and more.

The film also interviewed critics, who dismiss the Gerson Therapy as "pure quackery."

Kroschel followed up in 2008 with *The Beautiful Truth* about Garrett, a troubled 15-year-old boy coping with the death of his mother. As his first assignment for home-schooling, Garrett researched Dr. Gerson's claims of a diet that can cure cancer.

Is Dr. Gerson's therapy truly the legitimate, alternative cure it appears to be? In order to find out the truth, Garrett interviewed Dr. Gerson's family members, various doctors, skeptics, and cancer patients.

In the end, you decide the truth ...

*This cancer treatment is one of the crown jewels of alternative medicine. It is the strongest and fastest acting alternative cancer treatment which does not have any restrictions. It does not cause inflammation or swelling. It frequently shrinks tumors and reduces pain within a couple of weeks. It can be used by any advanced cancer patient dealing with any type of cancer.*

This treatment was specifically designed for advanced cancer patients who need to have an alternative cancer treatment which starts to become effective within days, not weeks or months.

This protocol is based on a combination of two of the fastest acting alternative cancer treatments available. Both the Collect

Protocol and the Budwig Protocol are known to be quickly effective, plus they avoid creating inflammation and swelling.

In addition to the two main treatments (Collect and Budwig), the protocol includes several other treatments which are very effective in getting rid of cancer cells, re-balancing the body (i.e. the inner terrain) and eliminating toxins from the body.

Advanced cancer patients are strongly advised to work with an expert in their main treatment protocol. This protocol has excellent support available from Mike Vrentas, who has more than 12 years' experience in alternative medicine and who designed this protocol. Not only did Mike develop a set of CDs with detailed information about the protocol but he also provides, as a very inexpensive option, telephone support for personal consultations.

Do not attempt this protocol without working with Mike Vrentas. This article cannot detail all of the different situations cancer patients might face when using this protocol. More will be said about his support below, but [here is Mike's website](#).

#### Treatment 1: Collect Powder

The key product in this protocol is a nutritional powder called Collect, which has shown excellent results with all forms of cancer and many other chronic or terminal health issues. Collect was developed by Fred Eichhorn who is the president of the National Cancer Research Foundation.

Fred completed four years of college Pre-Med and worked as a Surgical Organ Transplant Researcher. He is also a Bio-Chemist and cured himself of pancreatic cancer. The nutritional product Collect was created as a result of his research. (1)

A cancer patient should start out by building up to four scoops a day. The scoop is in the can, but due to shipping may have to be

gently removed as it may work its way down into the powder. Children, of course, should take smaller doses.

A cancer patient (adults) may find they can advance quickly (starting at 1/2 scoop) to the four scoops or more. In cases of the very ill, one may have to work up very slowly so their body can adjust. This could mean starting with as little as a half scoop of the powder per day, and then work up as their body can handle it.

Mike will fine-tune the doses for the long term and explain what else needs to be done. This is a very powerful protocol which is why telephone support is critical.

There have been some cases of constipation so be sure that for each scoop of Collect a person takes three of the Cod Liver Oil capsules which come with the product. Additional Cod Liver Oil capsules can be taken as well to alleviate constipation. Also in the case of constipation vegetable juicing works well. In the case of diarrhea; lessen the cod liver oil until one gets it under control.

The product Collect can be purchased by visiting their website. This product is NOT sold through multilevel marketing. However, Collect is sold through practitioners under the label Trican which could increase its cost.

If you take the powdered form, it needs to be mixed with a fruit juice (freshly squeezed), vegetable juice, or purple grape juice (partly to kill the taste). Look under “recipes” for additional ideas for taking the Collect powder at the link below.

**WARNING:** Collect also comes in pill or capsule form. However, it takes 25 capsules of Collect pills to equal one scoop. Thus, for example, if someone wanted to take five scoops of Collect they would need 125 capsules! For this reason, the capsule form of Collect is not recommended.

Use the Collect powder unflavored if possible. Using the flavored requires the consumption of more due to the volume

added because of the flavoring. This can become a real issue on higher doses.

Note 1: Do not take the product Collect and the Budwig Diet products within one and a half hours of each other.

Note 2: Collect should be taken immediately before a meal (to prevent stomach upset) and the cod liver oil should be taken during the meal. This ensures the cod liver is not taken within an hour and a half of the Budwig portion.

Here is their website to purchase the product: [Collect Vendor](#)

Here is their website with more technical information: [NCRF Technical Information](#)

Treatment 2: The Budwig Protocol

The Budwig Diet restores the electrical charge in cells. Due to the number of rules when using the Budwig Diet or Budwig Protocol, a separate article has been written on the Budwig Protocol. This article is Part 2 of the Collect-Budwig Protocol: [Budwig Diet](#)

Here is a detailed article on how to make the Budwig Diet mixture: [Budwig Diet Mixture](#)

Note 1: If someone is using a feeding tube, organic plain Kefir (as a replacement for the cottage cheese) will work to break down the [flaxseed oil](#). Use about four ounces of kefir to two tablespoons of [flaxseed oil](#) and thoroughly stir until the oil is gone. You may have to add more or less of the kefir.

Likely due to the detoxification effects of the Budwig protocol, the Collect-Budwig does require coffee enemas.

### Treatment 3: High RF Frequency Generator and Plasma Ray Tube Amplifier

Our experience has shown that the combination of Collect, Budwig, and the High RF Frequency Generator with Plasma Amplifier is a very potent combination. Each does something different and each is important for those who can afford an electromedicine device.

What this device adds to the Collect-Budwig protocol is the ability to safely and quickly remove cancer cells from the body. It also shrinks tumors, quickly in many cases, and it can reduce pain dramatically.

“Electromedicine” in alternative medicine is very gentle. In fact, the High RF Frequency Generator with Plasma Amplifier is amazingly gentle (you barely know it is turned on). Yet the frequency generator system can get rid of cancer cells in a very different way than the rest of the Collect-Budwig protocol. It reverts cancer cells into normal cells. Thus this protocol is synergistic with the other parts of the Collect-Budwig.

See the “[What Causes Cancer](#)” article if you want to know how it is possible to revert cancer cells into normal cells.

The High RF Frequency Generator with Plasma Amplifier is based on the Rife Machine technology of the 1930s and 1940s. [Dr. Royal Rife](#) designed his frequency generators to kill microbes

which were inside of the cancer cells. His “carrier wave” was designed to get the other frequencies past the cell membrane to get to the microbes.

Even though there are many “Rife Machines” on the Internet, the company that builds the High RF Frequency Generator with Plasma Amplifier actually studied machines built and delivered by Royal Rife before the AMA had him shut down. No other “Rife Machine” even comes close to the specifications of the High RF Frequency Generator with Plasma Amplifier.

Because the High RF Frequency Generator with Plasma Amplifier device is like a small radio tower (i.e. it broadcasts a signal in the air which goes more than 50 meters), it can be used on ANY type of cancer, including bone cancer, brain cancer, lymphoma, leukemia, colon cancer, liver cancer, pancreatic cancer, etc. There is nowhere in the body this device cannot get.

Where to buy the ICRF “Research Model” High RF Frequency Generator and Plasma Tube Amplifier: <http://www.FrequencyStore.com>

Go to the vendor’s website that sells the High RF Frequency Generator and oscillator plasma amplifier which can broadcast high RF frequencies using a plasma ray tube antenna. You’ll be able to see photographs of the generator and amplifiers including full specifications and pricing at their website. They offer excellent technical support.

Due to FDA regulations, photos and the actual names of the High RF Frequency Generator and amplifiers cannot be directly mentioned or linked to this website.

Visit the vendor's website to read more about the specifications and to actually see what the system looks like. You'll see the frequency generator with the plasma amplifier to the left. The plasma ray tube sits on top of the amplifier. It emits a signal similar to a radio tower so nothing touches the patient using it.

There are two different amplifiers. The most potent of the High RF Frequency Generator devices uses the plasma amplifier. It costs about \$4,700.

For those who cannot afford the plasma amplifier, the “little brother” of the plasma amplifier is a 15-watt linear amplifier. This “contact device” (using contact electrodes with the body) generates several gentle electrical currents instead of being like a radio tower which broadcasts 207-Watts from the antenna (plasma ray tube). The cost of the High RF Frequency Generator with the 15-Watt linear amplifier is about \$2,500.

A person does NOT need both types of amplifiers. The plasma ray tube connected to the plasma amplifier is highly recommended both because it is more powerful than the 15-Watt linear amplifier and because it directly reaches all parts of the body. This is because the output frequencies are radio waves (with many sidebands) instead of just an electrical current.

If you can afford to add one of the two amplifiers to the High RF Frequency Generator and this protocol, it is highly recommended.

For more detailed information, see: [Frequency Generators](#)

Note 1: There is a protocol from the ICRF for treating cancer for both of these High RF Frequency Generator devices. It is a step-by-step, button-by-button operator's manual. Mike Vrentas, who supports the Collect-Budwig protocol, can refer you to the location of the protocol.

Note 2: Electromedicine protocols cannot be used at the same time as strong prescription drugs. This is because the electromedicine may allow these drugs to get inside of cells, which is not where they are supposed to be. In the case of time-released drugs, this can be a serious problem if they are strong drugs. In the case of non-time-released drugs, they should be taken one hour AFTER the electromedicine protocols are finished for the day.

#### Treatment 4: Laetrile or Vitamin B17

Laetrile or Vitamin B17 is a strongly recommended part of this protocol. Laetrile is talked about in detail in the Collect/Budwig Audio CDs. Laetrile or B17 has been a major cancer treatment for several decades. It selectively kills cancer cells safely. It does not kill cancer cells so fast that it creates dangerous debris.

The best way to take laetrile is by I.V., however, federal regulators have made this illegal in the U.S. The most common way of taking laetrile is by eating apricot seeds (or apple seeds), which are high in laetrile or Vitamin B17. Laetrile tablets are also available and are also a very common way of taking laetrile.

The best way to take laetrile is a combination of laetrile tablets and apricot seeds. This way you get both high doses of laetrile (from the 500 mg tablets) and the nutrients that Mother Nature intended to be taken with laetrile (from the apricot seeds). The laetrile tablets should be taken 1/2 hour after a meal.

A cancer patient should start with three or four apricot seeds a day and build up to 25-30 apricot seeds per day or better yet take some combination of apricot seeds and laetrile tablets. Collect, which is part of this protocol, has many of the nutrients needed for laetrile to be utilized by the body.

When you get to this website look on the left side of the page and look for the “Frequently Asked Questions.” Then click on article 74. This is a key article: CureZone – See 74 (see link at bottom of this section)

For more information and vendors of apricot seeds, see the bottom of this web page: Article and Vendors of Laetrile

#### Treatment 5: Vegetable juicing

The vegetable juicing is critical for two major reasons. First of all, several vegetables are very high in anti-cancer nutrients. Second,

by focusing on vegetable juice you are crowding out the bad foods that most people eat.

Of course, the juicing would be of little value if you did not avoid foods which are feeding your cancer or creating an environment which is favorable to cancer cells (e.g. sugar, dairy products, etc. feed cancer cells and microbes).

A cancer patient should absolutely **AVOID** soda pops, including diet soda pops, highly processed foods (e.g. sugar, white flour), coffee, etc. Eating bad foods, especially highly acidic foods, such as those just mentioned, will **FEED** cancer or create an environment in the body in which the cancer cells can thrive.

Always remember that **NO** cancer treatment can be any stronger than the “cancer diet.”

The bottom line is to eat as much natural whole fruits and vegetables as possible and avoid highly processed foods.

It is **NOT** necessary to only drink vegetable juices, but a cancer patient should attempt to take about 40 ounces of vegetable juices daily. In the case of the very ill, one must start slowly when juicing and “build-up”, sometimes very slowly, to let the body adjust. Some may be able to build up to the full amount and others will not. Doing some is better than doing none.

The amount of vegetable juice one is able to consume will differ with each individual case. Be sure to spread out the juicing over several small drinks, every day. The 40-ounce volume is obviously for adults.

The “cancer diet” is also critical to stopping fast-spreading cancers. The alkaline environment created by a good “cancer diet” is literally the main technique to stop fast-spreading cancers in their tracks.

Carrots, carrot/apple, and green drinks should comprise the bulk of the vegetable juice. Here is an article on which vegetables are anti-cancer and how to put together a vegetable juice:

[Raw Food Diet](#)

Treatment 6: Importance of detoxification

See the information in the “Cardinal Rule” section below, as this is a very, very important part of this protocol. This is covered in detail in the Collect/Budwig Audio CDs.

Treatment No. 7: Real sunlight

It is very helpful to get out in the sunlight for about 45 minutes a day. One needs to start slowly so as not to burn, maybe starting with as little as 15 minutes per day working their way up. Do NOT use any type of sunscreen. Sunscreens filter out certain wavelengths of light and can actually cause skin cancer.

Alternative Cancer Treatments to avoid on this protocol

There are several alternative cancer treatments which should NOT be taken with this protocol:

- 1) Do NOT take cesium chloride, [Coral Calcium](#), or other alkaline products or supplements while on this protocol. The reason is that the Collect is already properly pH balanced and these protocols would push Collect out of balance.
- 2) Do NOT take Protocol, Cantron, Entlev, or Cancell (all are registered trademarks). These products work in the opposite manner as the Budwig Protocol and may offset the Budwig Diet.
- 3) Do NOT take any product with [Paw Paw](#) or [Graviola](#). This includes [Amazon Factor](#) Protocol. These plants also lower ATP energy and may offset the Budwig Diet.
- 4) Do NOT take [Vitamin C](#) within four hours of the Budwig diet.
- 5) Do NOT take Eniva [Vibe liquid](#).

Liver flushes

The Collect powder includes items to build the immune system, so additional immune builders are not likely needed.

However, the Collect-Budwig does not automatically come with a liver flush as far as I know. A liver flush, which is designed to kill the microbes and parasites in the organs, is a major immune-building item which all cancer patients need to use.

Generally, three or four items in the Reference Manual, item #3, can be used for a liver flush:

Reference Manual (#3)

Cardinal rule: Work with an expert.

Cancer is a relentless disease and all advanced cancer patients and/or caregivers must work with an expert, either in person or by detailed documentation, to deal with the many things a caregiver needs to know about treating advanced cancer. The experience of an expert is many times more important than common sense.

Almost by definition, this protocol will be used by advanced cancer patients. In addition, this is a very potent treatment and patients need to know what to do when the potency of this treatment becomes evident. When one uses alternative cancer treatments many times there is a die off of dead cells and release of toxins from the body. One needs to know how to remove this toxic load from the body as quickly as possible.

Upon elimination of toxins from the body we have heard time and again how much better a person feels almost immediately, leaving the person feeling calm and relaxed, clear headed and a sense of well-being. One needs to understand this in detail. This is one of many reasons for working with an expert when possible.

The critical issue of detoxification is covered in detail in the CDs but is beyond the scope of this article.

But you must remember when dealing with the toxic load created by any of the fast-acting alternative cancer treatments, such as this one, you need to understand the symptoms of the detoxification load and all of your options for dealing with the toxic load, especially with regards to protecting the liver.

This is a potent treatment, do not underestimate the need for good information.

Published support for this protocol

Due to the fact that Mike Vrentas, who designed this protocol, has a finite amount of time to help cancer patients, and because this is a popular treatment, Mike has produced a set of audio files which take five and one-half hours to listen to. These audio files were the result of consulting with cancer patients using this protocol. There is a great deal of critical information in these audio files.

To be blunt, because of the potential for unexpected symptoms and knowing how to handle them, it is unthinkable to attempt this treatment without the audio book. The information in these files is an essential part of this protocol.

The audio book should be listened to at least twice during the treatment; once at the beginning of the treatment and once when the patient has built-up to the full doses.

Without listening to this audio book it is almost guaranteed the caregiver will do exactly the wrong thing to deal with the patient's weakness. I don't know how else to explain the importance of these lectures.

Mike has priced these audio tapes to be less than half of the cost of a single can of Celect. They are available for immediate download (using broadband) or on CD. You may want to listen to these tapes even if you don't go on this treatment because they will help any cancer patient on any treatment.

The information Mike has provided in the downloads or CDs is a step-by-step explanation of the above protocol. It includes a great deal of information on individual cases and the science behind the protocol, including the information on how the protocol works to re-balance the basic chemistry of your body. Very important to the protocol as well, is the detailed information on how to identify and deal with detoxification.

Please see this free, short YouTube video about his set of audio files: [Your Road to Health – Collect/Budwig and More](#)

One-on-one support for this protocol

In almost all cases a patient needs customized information for their specific case. [Mike can be contacted by email](#) to set up a telephone consultation (for international contacts, Mike has Skype). Mike is an expert in every phase of this treatment. He charges a very modest one-time consultation fee of \$295. There is no additional charge for continued support. It is well worth it. Mike is also an excellent motivator to get a patient to do it right.

Note for brain and lung cancer patients

Swelling and inflammation can be very dangerous for brain cancer and lung cancer patients. There is nothing in this treatment that will create added swelling or inflammation. However, one reason you need to be careful about adding things to this treatment is because many alternative cancer treatments do cause temporary swelling or inflammation. In other words, be very, very careful about adding items to this treatment.

If swelling and inflammation are currently a problem, and if you are on any prescription drugs designed to reduce swelling, you should know that this treatment will not interfere with the drugs, except perhaps for the electromedicine devices.

If you have brain cancer and carry with you prescription drugs in case of brain inflammation, make sure you have someone with you

at all times who knows how to administer these drugs in case of an emergency.

However, one thing you can do to help with any potential swelling is to rub a teaspoon of DMSO on the back of your neck. Spread it thin. This is one of the transdermal ways of taking DMSO. DMSO will quickly penetrate the blood-brain-barrier and will help reduce swelling in the brain. DMSO should not be taken within two hours (before or after) of taking any prescription drugs.

Here is a vendor of DMSO: Herbs Pro (use the 70/30 for transdermal)

### Optional treatments to the Collect-Budwig Protocol

There are several alternative cancer treatments which are not part of the Collect-Budwig protocol partly because one of them is expensive and partly because this is already an extensive protocol. But for those who can afford the first treatment and/or has time to do the other treatments, they are highly recommended to be included in the Collect-Budwig.

#### Fucoidan

Fucoidan is a potent way to quickly and safely kill cancer cells. More than 100 scientific studies have demonstrated the effectiveness of “fucoidan” (the key sugar/nutrient in Fucoidan) to kill cancer cells.

What this protocol adds to the Collect-Budwig is the enhanced ability to quickly get rid of cancer cells. It is very synergistic with the Collect-Budwig.

Only the brand recommended by this website should be used for cancer because this is the brand/company that owns many of the key patents for extracting fucoidan. That is why this product costs as much as the Collect.

Here is a link to [an article on Fucoidan](#).

MSM / CS Protocol — Methyl Sulfonyl Methane (MSM) / Colloidal Silver (CS)

The MSM/CS protocol is focused on killing microbes in the bloodstream and killing microbes inside the cancer cells (see [What Causes Cancer](#)). The MSM helps get the colloidal silver inside the cancer cells. A cancer patient cannot have too many treatments that can kill microbes in the bloodstream and inside the cancer cells.

Eliminating microbes from the bloodstream helps build the immune system because the immune system is burdened by about two pounds of microbes in the body. Killing microbes inside the cancer cells helps revert cancer cells into normal cells. Thus, this protocol is very synergistic with the High RF Frequency Protocol.

This protocol is required for those who are not on the High RF Frequency Protocol.

This protocol is also absolutely required for any patient with cachexia because the MSM helps flush lactic acid out of the bloodstream. Those with cachexia should “build-up” (i.e. slowly increase the dose) the level of MSM until it is double the dose of MSM in the MSM/CS article.

The MSM/CS is also required for squamous cell carcinoma, sarcomas, uterine cancer, and melanomas because these types of cancer spread by microbes in the bloodstream. See this article: [Article For SCC, Melanoma, etc.](#)

Here is the treatment article: [MSM/CS Protocol](#)

Blood purifier from the Bob Beck Protocol

For those who have read [Prevent Cancer From Returning](#), you will note that the strongly recommended procedure is to follow the Collect-Budwig Protocol with protocols that focus on eliminating lactic acid, eliminating microbes in the bloodstream and eliminating microbes inside the cancer cells.

Reading this article after the Collect-Budwig Protocol is absolutely critical because the focus of the Collect-Budwig Protocol is to keep an advanced cancer patient alive and deal with the cancer cells. But the Collect-Budwig does not, and should not, deal with some of the long-term “clean-up” issues, such as lactic acid.

Nevertheless, to some degree dealing with lactic acid is covered by the MSM/CS Protocol. This same protocol also deals with microbes in the bloodstream. But adding the Blood Purifier will greatly enhance dealing with the microbes in the bloodstream. There are two massively important reasons to use the blood purifier of the Bob Beck Protocol with the Collect-Budwig protocol.

First, because it cleans the blood of microbes, it helps build the immune system. Second, it clears a path for the MSM/Colloidal Silver, mentioned above, to reach the cancer cells.

With regards to the first item, building the immune system, this takes time. Thus, the earlier you start the Blood Purifier the sooner it will become effective at building the immune system.

There are actually four parts to the Bob Beck Protocol:

- The Blood Purifier
- Colloidal Silver (handled by the MSM/CS protocol)
- Magnetic Pulser (handled by the High RF Frequency Generator microbe protocol)
- Ozonated Water (handled by the Fucoidan)

Thus, only one of these items, the blood purifier, is not already handled by the Collect-Budwig with Fucoidan and MSM/CS. So the entire Bob Beck Protocol can be achieved simply by adding the Blood Purifier.

The recommended vendor is Sota Instruments of Canada. They call the blood purifier a Silver Pulser. Thus, it is recommended to buy and use the Silver Pulser during the same two hours you are

using the High RF Frequency Generator/Plasma Amplifier protocol.

This protocol is also absolutely required for squamous cell carcinoma, sarcomas, uterine cancer and melanomas because these types of cancer spread by microbes in the bloodstream. See this article: [Article For SCC, Melanoma, etc.](#)

Here is a link to the article and the recommended vendor: [Bob Beck Blood Purifier article \(use Sota Instruments\)](#)

<http://www.cellectbudwig.com/>

The Budwig Diet, meaning the Budwig Protocol (it is actually not a “diet,” but rather a specific mixture) is necessary for many alternative treatments; from type 2 diabetes to cancer to heart disease to autoimmune diseases, etc.

Its purpose is to energize the cells by restoring the natural electrical balance in the cell. Many human diseases are caused by “sick cells” which have lost their normal electrical balance; generally via a lower ATP energy in the cell's mitochondria.

One thing to understand, and this is critical, is that the purpose of the Budwig Diet is to convert oil-soluble omega-3 fatty acids into water-soluble omega-3 fatty acids.

This is why it is so important to add things to the mixture in the right order. If you mix them in the wrong order you may lose a lot

of the opportunity to convert the oil-soluble omega-3s into water soluble-omega-3s.

Since someone may “hit” this article directly from the Internet, here are a few resources on the theory behind the Budwig Diet and the use of the Budwig Diet.

Here is an article on the Budwig Diet by cancer researcher Mike Vrentas:

[Budwig Diet](#)

Here is another article on the Budwig Diet which was written by another Budwig expert:

[Healing Cancer Naturally](#)

Here is a DVD which details an [entire day on the Budwig Protocol](#):

[Entire Day on the Budwig](#)

*Clinics that offer*

Budwig Protocol

Cancer Tutor Verified

The Ingredients

Here are the ingredients to make the Budwig Diet and how to mix them together.

Item #1: Refrigerated, Liquid [Flaxseed Oil](#)

This is generally purchased at a health food store. For people who do not live near a health food store, they can order it over the

Internet. Even if it takes a few days of travel to arrive at your house, leaving it unrefrigerated for this period should not affect the product. But after it arrives refrigerate it.

The most popular brand is Barlean's Flax Oil, but there are other brands. The key is that it is liquid and has far more omega 3s than omega 6s. For example, my bottle (Barlean's) has 6,200 mg of omega 3s to 1,810 mg of omega 6s. The reason for this ratio is that a normal diet will have far more omega 6 than omega 3, thus the supplement must have far more omega 3 than omega 6.

One main issue is “lignans.” Lignans are particles which contain fiber. Some people claim you should buy non-lignan versions of flax oil and some people suggest you buy high lignan varieties.

The answer really depends on what you are using it for. For example, if you are using it for stomach cancer, and are on the Collect-Budwig protocol or Bill Henderson protocol, then you definitely need the “high lignan” version. This is because the stomach needs the fiber.

On the other hand, Mike Vrentas recommends no lignin varieties for other types of cancer patients. However, his reason is that it is hard to tell when the lignan version becomes rancid. This is generally not an issue in high volume health food stores.

What you use is up to you and your research.

Shake the flaxseed oil well before putting it in the bowl.

Item #2: Cottage Cheese (U.S. Variety) or Yogurt

Here are the basic instructions on how to make the Budwig Mixture.

Grind with a small coffee grinder (1) Tbsp of Flax Seed and put in a small bowl. Do not buy pre-ground flax seed as the flax seed

goes rancid 15 minutes after grinding. Brown or Golden whole Flaxseed is available and either will work. Grind fresh each time.

We have always recommended using the immersion [stick or wand like] mixer for the Flax Seed Oil and Cottage Cheese. Here is a link to immersion mixers:

[Immersion Mixer Vendor](#)

Mix (4) Tbs of organic 2% low fat Cottage Cheese with (2) Tbs organic cold pressed Flax Seed Oil commonly referred to as (Flax Oil). It is best (not) to use Flavored, Lignum or Highest Lignum Flax Oil. Two good flax oils are Barlean's or Spectrum's cold pressed organic flax oil. This can be found in the refrigerated section of the grocery or health food store. Never off the shelf. Never capsule or flakes. Watch the expiration date. Blend the flax oil and cottage cheese together with the immersion blender until reaching a creamy quality and the oil has been absorbed. There should be no standing oil.

Then add to this mixture if needed, 1-3 Tbs of low-fat milk for a creamier mixture and (stir with a spoon) no blender. This mixture should then be poured over the freshly ground flax seed and mixed together by spoon; again no blender. The ratio may be adjusted for smaller or larger proportions. A rule of thumb to keep in mind is one tablespoon of oil to two tablespoons of cottage cheese. The amount of milk can be adjusted as needed for consistency and easier blending. Once the mixture is completed it must be eaten immediately for best results. Make fresh each time. Here's the link to the (YouTube) page showing how to combine the Flax Oil and Cottage Cheese in a video.

<http://www.youtube.com/watch?v=RSoddptWL0s>

The above mixture can be flavored differently every day by adding nuts, preferably organic such as pecans, almonds or walnuts (not peanuts), banana, organic cocoa, shredded coconut, pineapple (fresh) blueberries, raspberries, cinnamon, vanilla or (freshly) squeezed fruit juice. It's usually best to place the fresh fruit on top of the completed mixture and enjoy as its own meal. Try your best

to obtain organic fruit when possible. Many times this can be found frozen when not in season.

The above protocol should not be consumed with any other supplements, foods or oils at the same time. This should be a stand alone meal.

Dr. Budwig pointed out that people who are suffering from chronic or terminal disease should work themselves up to consuming 4-8 Tbsp of the oil daily. Usually the higher limits 6-8 Tbsp were for people with cancer. She stated, people with Liver or Pancreatic Cancer etc, may have to work up very slowly with the oil and possibly only start with 1 teaspoon at a time giving their body time to adjust. Dr. Budwig pointed out that cancer patients once starting the protocol and getting it under control must continue with a maintenance dose to prevent recurrence.

A maintenance dose is considered (1) Tbs of the oil per one hundred pounds of body weight. The Budwig Diet takes time to work and in the event of cancer may take three to six months. Many other health issues can be much faster in responding.

### Item #3: Cinnamon

Each brand of cinnamon has an oil content. For diabetic patients it is critical to go to a health food store and buy the highest percentage of oil as possible. Cinnamon mimics insulin, thus by adding cinnamon you may need less insulin immediately. See the article on how to cure type 2 diabetes for more information because other things also mimic insulin:

[Diabetes Type II article](#)

For everyone else, the main purpose of the cinnamon is to kill the taste of the flaxseed oil and cod liver oil, so the oil content is not that important.

#### Item #4: Mandarin Oranges or Some Other Fruit

The sole purpose of this item is for taste, thus add whatever fruits you wish.

#### Final Important Comments

You must consume the Budwig mixture within 20 minutes of making it. Do not make more than you need and do not refrigerate the leftovers.

Also, don't forget to put the cottage cheese into the bowl first, then the flaxseed oil. Then mix the two together before putting anything else in the bowl.

See the individual treatment articles for more information on how to use the Budwig Diet for that particular health condition.

*The Budwig Diet is a potent cancer treatment. However, the Budwig Diet is now part of a far stronger protocol — the Collect-Budwig Protocol. The news gets better: The Collect-Budwig Protocol comes with expert support from cancer researcher Mike Vrentas. It is strongly advised that a cancer patient uses the Collect-Budwig Protocol or one of the other major protocols.*

*Clinics that offer*

Budwig Protocol

Cancer Tutor Verified

In my research, Dr. Johanna Budwig's name has been referred to on numerous occasions. The articles mentioned that Dr. Budwig was using organic flaxseed oil combined with organic low fat cottage cheese in preventing and curing Cancer and Chronic Diseases. I would just shake my head in disbelief and, without giving it a second thought, move on to other research. I was not willing to take the time to investigate this protocol. It did not make any sense to me how this could possibly work. That was a big mistake on my part.

If you are researching this website for a loved one, family member, or a friend who is suffering from a terminal or chronic disease this is one of the most important pieces of information I have come across during thousands of hours of research. Please take the time to read this carefully as this can be a life-saving protocol.

If you are already familiar with the science on how the Budwig Diet works you may scroll directly down to (The Budwig Protocol and diet plan). There it will guide you in what to purchase and how to mix the organic flax oil and organic low fat cottage cheese as well as some explanation to the diet.

To understand the full diet, her book will have to be purchased (links to her books are below). In Dr. Budwig's protocol, there is much more than just flax oil and cottage cheese. If you are just now hearing about this protocol for the first time you need to read this paper in its entirety to understand how this protocol works in healing your body. This is a very, very powerful protocol when done properly and has healed thousands of people with chronic and terminal diseases.

One afternoon I decided to take the time to start researching Dr. Budwig. I wanted to know who she was and learn more about her protocol. I had no idea that two months later, after reading three of her books translated from German to English and combing the internet, I would still be looking at Dr. Budwig's work. I was trying my best to understand this protocol so I could pass it along

to others. I believe I now understand why it appears to work so well. The following is what my research revealed.

Dr. Budwig was born in Germany in 1908. She passed away in 2003 at the age of 95. She has been referred to as a top European cancer research scientist, biochemist, blood specialist, German pharmacologist, and physicist. Dr. Budwig was a seven-time Nobel Prize nominee.

In Germany in 1952, she was the central government's senior expert for fats and pharmaceutical drugs. She's considered one of the world's leading authorities on fats and oils. Her research has shown the tremendous effects that commercially processed fats and oils have in destroying cell membranes and lowering the voltage in the cells of our bodies, which then result in chronic and terminal disease. What we have forgotten is that we are body electric.

The cells of our body fire electrically. They have a nucleus in the center of the cell which is positively charged, and the cell membrane, which is the outer lining of the cell, is negatively charged. We are all aware of how fats clog up our veins and arteries and are the leading cause of heart attacks, but we never looked beyond the end of our noses to see how these very dangerous fats and oils are affecting the overall health of our minds and bodies at the cellular level.

Dr. Budwig discovered that when unsaturated fats have been chemically treated, their unsaturated qualities are destroyed and the field of electrons removed. This commercial processing of fats destroys the field of electrons that the cell membranes (60-75 trillion cells) in our bodies must have to fire properly (i.e. function properly).

The fats' ability to associate with protein and thereby to achieve water solubility in the fluids of the living body—all this is destroyed. As Dr. Budwig put it, “the battery is dead because the electrons in these fats and oils recharge it.” When the electrons are

destroyed the fats are no longer active and cannot flow into the capillaries and through the fine capillary networks. This is when circulation problems arise.

Without the proper metabolism of fats in our bodies, every vital function and every organ is affected. This includes the generation of new life and new cells. Our bodies produce over 500 million new cells daily. Dr. Budwig points out that in growing new cells, there is a polarity between the electrically positive nucleus and the electrically negative cell membrane with its high unsaturated fatty acids. During cell division, the cell, and new daughter cell must contain enough electron-rich fatty acids in the cell's surface area to divide off completely from the old cell. When this process is interrupted the body begins to die. In essence, these commercially processed fats and oils are shutting down the electrical field of the cells allowing chronic and terminal diseases to take hold of our bodies.

A very good example would be tumors. Dr. Budwig noted that “The formation of tumors usually happens as follows. In those body areas which normally host many growth processes, such as in the skin and membranes, the glandular organs, for example, the liver and pancreas or the glands in the stomach and intestinal tract—it is here that the growth processes are brought to a stand still. Because the polarity is missing, due to the lack of electron rich highly unsaturated fat, the course of growth is disturbed—the surface-active fats are not present; the substance becomes inactive before the maturing and shedding process of the cells ever takes place, which results in the formation of tumors.”

She pointed out that this can be reversed by providing the simple foods, cottage cheese, and flax seed oil, which revises the stagnated growth processes. This naturally causes the tumor or tumors present to dissolve and the whole range of symptoms which indicate a “dead battery are cured.” Dr. Budwig did not believe in the use of growth-inhibiting treatments such as chemotherapy or radiation. She was quoted as saying “I flat declare that the usual hospital treatments today, in a case of

tumorous growth, most certainly leads to worsening of the disease or a speedier death, and in healthy people, quickly causes cancer.”

Dr. Budwig discovered that when she combined flaxseed oil, with its powerful healing nature of essential electron rich unsaturated fats, and cottage cheese, which is rich in sulfur protein, the chemical reaction produced makes the oil water soluble and easily absorbed into the cell membrane.

I found testimonials of people from around the world who had been diagnosed with terminal cancer (all types of cancer), sent home to die and were now actually cured and living healthy, normal lives. Not only had Dr Budwig been using her protocol for treating cancer in Europe, but she also treated other chronic diseases such as arthritis, heart infarction, irregular heart beat, psoriasis, eczema (other skin diseases), immune deficiency syndromes (Multiple Sclerosis and other autoimmune diseases), diabetes, lungs (respiratory conditions), stomach ulcers, liver, prostate, strokes, brain tumors, brain (strengthens activity), arteriosclerosis and other chronic diseases. Dr. Budwig’s protocol proved successful where orthodox traditional medicine was failing.

Since Dr. Budwig mentioned the strengthening of the brain, I believe not only Multiple Sclerosis, but also ALS “Lou Gehrig’s Disease”, Parkinson’s disease, and Alzheimer’s disease could also be significantly impacted with her protocol. I also believe that this protocol could have the greatest impact early into the disease, and could very possibly reverse these diseases entirely. Dr. Budwig states, “A Swede has proved that (no brain function) can take place at all without three-fold unsaturated fats. Without any doubt, every function of the brain—and this has been scientifically proved—needs the very easy activation effect of three-fold unsaturated fats.

“The same applies to nerve functions and for regeneration within the muscle after strenuous muscle activity, in the so-called oxidative recovery phase during sleep. This process requires the highly unsaturated, particularly electron-rich fatty acids in flax seed

oil. So, when I wish to help a very sick patient, I must first give the most optimal oil I have. My opinion is flax seed oil.”

Dr. Budwig pointed out in her book that she often took very sick cancer patients from the hospital with only hours or a few days left to live and had very good results with her protocol, most of the time. I would assume some patients she worked with were too badly damaged by the chemotherapy and radiation treatments. She pointed out that in some of these patients she would start their therapy with an enema of 500 CCs of an oil mixture and “that their subjective awareness of well-being increased immediately.”

She pointed out that many could not urinate, produce bowel movements, or when coughing were unable to bring up the mucous, but once the protocol was initiated this started reactivation of the vital functions and the patients immediately began feeling better. The Budwig diet appears to allow cancer cells to start breathing again.

Here are a couple of testimonials I found quite interesting and thought I would share with you. These testimonials were found in Cliff Beckwith’s website:

### Testimonials

Cliff’s story and his recovery from Stage IV Prostate Cancer using Budwig’s Protocol are also there along with other cancer testimonials including lung, colon, breast, ovarian, brain cancer and much more.

1. In a Christmas letter, Dec. 1993, we heard that a friend of ours in Wooster, Ohio, was having a bout with ovarian cancer. The blood test for that condition is GAC 125 and the normal is 35 or below. Her count was 75. Later I learned she'd visited my sister in September and was very apprehensive. She'd had about four rounds of chemo (i.e. many chemotherapy sessions) and couldn't take that. We sent information about Flaxseed oil in our Christmas letter.

Joanie is an RN and she and her husband had been missionaries in Sri Lanka. They bought the books and started using Flax oil. In February she was feeling fine. On May 12, 1994, she had a checkup and the count was two and she was praising the Lord. In October 1994 she had another physical and now the count was one. Since then there's been no further indication of cancer.

2. We were asked by a friend to send a tape to his son whose wife was badly off with cancer. We have just learned that the daughter-in-law had cancer through her lymphatic system and her brain. She used 4 Tbsp. of oil a day and today the tests for cancer are normal. The doctors can't figure out what's happened and she is not saying anything. However, her husband, mother, father, and sisters are all using Flax oil for prevention.

Here's a testimonial for man's best friend, and I've read where it works on cats too.

3. Several weeks ago a man called us from South Bend, Indiana. He said, "You'll enjoy this. I have a 13-year-old dog. He has cancer. His eyes were dull and he was so weak he couldn't lift his leg. I should have put him to sleep, but I didn't want to. I put 1 Tbsp. of Flax oil and a half cup of cottage cheese in his bowl and he wolfed it down. I did that three times a day for ten weeks. Today he's running all over the place, his eyes are bright, his coat is shiny and he's gaining weight." That was the second dog I'd heard of in three days that showed improvement from using Flax oil. The other is owned by my cousin's daughter.

This second set of testimonials was taken from a FlaxSeedOil2 Chat group. The purpose of this group is for information and discussion of Dr. Johanna Budwig's Oil-Protein Diet and Protocol. FlaxSeedOil2 appears to be one of the best sources of reliable information on the Budwig Protocol in the English-speaking world. The following link for additional testimonies is (scroll down to FSO2 Folder 6 – Anecdotes & Testimonials. Click and read away at all the testimonials):

(Note: This link requires that you have a Yahoo email account and join the group)

Flax Oil Chat Group

1. From: "Bill and Nancy Parsons" <huckink@poncacity.net>

Date: Thu Oct 2, 2003, 10:31 p.m.

Subject: Re: [FlaxSeedOil2] mom dx with nslc 8/03

Hello Elena,

I feel real good about my case and will very soon have tests done that should give a definitive answer to how I am doing. I was diagnosed on Oct. 8, 2002, with a large breast cancer — "lobular infiltrating carcinoma". I began that same day on FO/CC. My cancer was very painful at first – in fact, that is when I discovered it, was when the pain awakened me at 5:00 a.m. I started that same day eating FO/CC (Flax Oil/ low fat cottage cheese). By the middle of November, my pain was all gone and I have remained pain-free. The tumor has shrunk dramatically, and my doctor was even amazed. On October 14, I will have a C.A.T. scan. I have already had a P.E.T. scan. The results of both of these scans will tell me the whole story.

With the P.E.T. scan, they injected into my veins sugar and radioactive-isotopes. The sugar goes to all spots in my body where there is any cancer, and will even show how large it is. It can be tracked by the radioactive isotopes. I can still feel a small ridge and I have wondered if that is scar tissue (since it has been so long since I have felt any pain). Well, now when I get these results, I will know if it is still cancer or just scar tissue. I will post to this group whatever my results are.

I had no doubts about beginning on the FL/CC regimen, as my husband had a very large and metastasized pancreatic cancer, in 1994.

He took many things in the alternative field, but NOTHING IN the medical field, (unless you want to consider his 3 weeks of IV treatments of Laetrile).

He also took FO/CC 3 times a day.

To his surgeon's astonishment, he was well in 5 months. After the surgery the surgeon had told us that he would die and that he might live 3 to 6 months – 3 being most likely.

He had gotten ill at the end of December 1993 and was in and out of the hospital until May 25, he had exploratory surgery and got the grim reports I reported above. But after we got home and got him on the juicing, he just began getting better. I was making fresh vegetable juice and giving him 12 ounces about every 2 hours. And we followed the diet scrupulously – no meat, absolutely no pork, no sugar, no processed foods of any kind, etc. etc. and he just kept getting better.

Finally, in November 1994, I wrote to the surgeon and ask him if he would schedule a CT scan for when we had an appointment on December 5, 1994.

He did that and when he came to give us the report, he was just shaking his head. He said “I don't know what to tell you folks, but there is no cancer in there. I even had the radiologist come back and study that with me and we can see nothing abnormal in there of any kind.” So with that kind of encouragement, I felt confident to do basically the same thing. Except that in the meantime, I have learned a lot more about FO/CC and so I am going mostly all the way with that. I guess you could say I have put all my eggs in that one basket. I know this is a long message and I am sorry. I hope it helps your mother. My husband was 54 the year he got sick. He is still well and still with me today.

Hope this helps, Nan

2. There is a melanoma case in Dr. Budwig's book "Der Tod des Tumors" (The Death of the Tumor) p.85.

I will give a partial and loose translation of it and paraphrase the first paragraph:

A Mrs. Harriett had a malignant melanoma cut out of her thigh. About one and a half years later she had lymph node metastasis at her left temple, which was treated with radiation. Four months after that she had lymph node metastasis at her left neck which was also brought under control with radiation. Two months after that she had several skin metastases over her body. That is when she came to Dr. Budwig, evidently on her own. What follows are excerpts of a letter from the woman's doctor to Dr. Budwig:

"A patient of mine, Mrs. Harriett, has recently been treated by you..." A detailed history with dates follows as outlined above without dates. "...After your treatment, all lymph nodes and skin metastasis were in remission. Also, all blood test indicators were normalized. I have never seen this happening with metastasized malignant melanoma. I would be extremely thankful if you could tell me which therapy you used. Since I have another patient with the same illness, I would be glad to send her to you so as to extend her life. On the other hand, I would naturally also gladly treat this patient here if you would instruct me of the method you used."

---

The above information I found intriguing, but I still questioned why combining flaxseed oil and cottage cheese together was the impact on the body so intensive? I believe I have found the reason and it's mentioned below in several different excerpts from her book.

The following excerpt is from Dr. Budwig's book *Flax Oil as a True Aid Against Arthritis, Heart Infarction, Cancer and Other Diseases* which was translated from German into English. This book is a

must read for anyone trying to heal themselves from a terminal or chronic disease.

Dr. Budwig states “What we need in Europe today, in Germany as well as in Switzerland, America, and France, what we really need are electron rich highly unsaturated fats. The moment two unsaturated double links occur together in a fatty acid chain, the effects are multiplied and in the highly unsaturated fats, the so-called “linoleic” acids, there is generated a field of electrons, a veritable electrical charge which can be quickly conducted off into the body, thus causing a recharging of the living substance — especially of the brain and nerves. It is exactly those highly unsaturated fatty acids which play a decisive role in the respiratory functioning of the body. Without these fatty acids, the enzymes in the breath can not function and we asphyxiate, even when given extra oxygen, as for examples in hospitals. The lack of these highly unsaturated fatty acids paralyzes many vital functions. Primarily, it cuts off the air we breath. We can not survive without air and food and we cannot survive without these fatty acids — that was proven long ago.”

Dr. Budwig, in her book, brought up other areas of interest and how electron-rich fats affect other vital functions of the body. I will mention them, but will not go into any detail, as one may purchase her books to learn much more than presented in this paper. The lack of electron rich unsaturated fats affect; respiratory enzyme function — It is basically proven that highly unsaturated fatty acids are the undiscovered decisive factor in achieving the desired effect of cellular respiratory stimulation:

- All glands of the body
- Brain Function- Including mental and spiritual
- Scholastic performance of children
- Function of the Heart — Proper firing of the heart
- Marital infertility
- Moral and behavior problems
- Human sexual relationships
- Cell division

- Formation of tumors
- Ingestion of wrong fats — Humans will eat six times their normal amount of food

Dr. Budwig, in her book, also brought up the relationship between the Fats Syndrome, Electrons, Photons, and Solar Energy provided by the Sun.

She pointed out that the sun is an inexhaustible source of energy and an element of life that affects the vital functions of the body. This, in part, is due to the photons in sunlight which are the purest form of energy, the purest wave, and in continual movement. Dr. Budwig states, “electrons are already a constituent of matter, even though they are also in continual movement and that electrons love photons, attracting each other due to their magnetic fields. There is nothing else on earth with a higher concentration of photons of the sun’s energy than man. This concentration of the sun’s energy — very much an iso-energetic point for humans, with their eminently suitable wavelengths — is improved when we eat food which has electrons which in turn attract the electromagnetic waves of sunbeams, of photons.

“A high amount of these electrons which are on the wavelength of the sun’s energy, are to be found, for example, in seed oils. Scientifically, these oils are even known as electron-rich essential highly unsaturated fats. But, when people began to treat fats to make them keep longer, no-one stopped to consider the consequences of this, for the existence and higher development of the human race. These vitally important amounts of electrons, with their continual movement and the wonderful reaction of light, were destroyed.”

Dr. Budwig found when she treated patients and had them lie in the sun she noticed they started feeling much better and became rejuvenated. She referred to the sun as having a stimulating effect on the secretions of the liver, gall bladder, pancreas, bladder and salivary glands. Dr. Budwig also stated “Matter always has its own vibration, and so, of course, does the living body. The absorption

of energy must correspond to one's own wavelength." It appears apparently that sunlight is absolutely essential for the stimulation effect of the vital functions of the mind and body, contributing to the factors which allow the body to heal itself.

Dr. Budwig mentioned that doctors tell patients and cancer patients to avoid the sun as they can't tolerate it and that is correct. She says once these patients start on her oil-protein nutritional advice for two or three days which means they have been getting sufficient amounts of essential fats, they can then tolerate the sun very well. She said the patients then tell her how much better they feel as their vitality and vigor is re-stimulated.

The last of the points mentioned by Dr. Budwig, and maybe the most important, is the electrons in our food serve as the resonance system for the sun's energy and are truly the element of life. Man acts as an antenna for the sun. The interplay between the photons in the sunbeams and the electrons in the seed oils and our foods governs all the vital functions of the body.

This has to be one of the greatest discoveries ever made as this combination promotes healing in the body of chronic and terminal diseases. In her book, Dr. Budwig states "Various highly trained and educated individuals are dismayed and irritated by the fact that serious medical conditions can be cured by cottage cheese and flaxseed oil."

The mixing of the oil and cottage cheese allows for the chemical reaction to take place between the sulfur protein in the cottage cheese and the oil, which makes the oil water soluble for easy absorption into your cells.

### The Budwig Protocol

The mixing ratio is two tablespoons of cottage cheese to one tablespoon of oil. Mix only the amount you are consuming at one time so it is mixed fresh each and every time. One example would be to mix (4) tablespoons of cottage cheese to (2) tablespoons of

flax oil, consumed twice daily or more depending on the severity of the health condition, one is attempting to address. One should probably start slowly with the oil, maybe just once a day and work their way up letting the body adjust to the protocol. The oil and the cottage cheese must be thoroughly mixed at a low speed, using an Immersion Blender, blending until a creamy texture with no standing oil is achieved.

The mixture should then be immediately consumed.

Do not add anything to the mixture until *after* it is mixed.

We have always recommended using the immersion [stick or wand like] mixer for the flaxseed oil and cottage cheese. Here is a link to [an immersion mixer](#).

One may want to consider sprinkling a tablespoon or two of freshly ground flaxseed over the top of the freshly mixed flax oil and cottage cheese mixture. Mix this in by hand. This supercharges the protocol. Do not buy pre-ground flax seed as the flax seed goes rancid 15 minutes after grinding. Brown or golden whole flaxseed is available at the health food stores and either will work. You may grind up the fresh flax seed with a small coffee grinder. Store the seeds in the refrigerator and grind fresh each time.

You may also stir in with a spoon 2-3 tablespoons of organic low-fat milk for a creamier mixture. This can be mixed in by hand after the initial blending. The mixture can be flavored differently every day by adding nuts, preferably organic such as pecans, almonds or walnuts (not peanuts), banana, organic cocoa, organic shredded coconut, pineapple (fresh), blueberries, raspberries, cinnamon, or (freshly) squeezed fruit juice. It's usually best to place the fresh fruit on top of the completed mixture and enjoy as its own meal. Try your best to obtain organic fruit when possible. Many times this can be found frozen when not in season.

Dr. Budwig pointed out that people who are suffering from chronic or terminal disease should work themselves up to consuming 4 – 8 Tbs of the oil daily. Usually, the higher limits 6-8 Tbsp were for people with cancer. She stated people with liver or pancreatic cancer etc, may have to work up very slowly with the oil and possibly only start with 1 teaspoon at a time giving their body time to adjust. Dr. Budwig pointed out that cancer patients once starting the protocol and getting it under control must continue with a maintenance dose to prevent reoccurrence. A maintenance dose is considered (1) Tbsp of the oil per 100 pounds of body weight. The Budwig Diet takes time to work and in the event of cancer, tumors, etc may take 3-6 months to see results. Many other health issues may respond much faster.

Also here is [a very good YouTube video](#) which actually shows how to make the flax oil and cottage cheese mixture correctly. When starting the protocol you would not want to make such a large amount at first, as shown in the video.

If you are lactose intolerant you may want to try the following. Since commercial milk is pasteurized, beneficial bacteria and enzymes in the milk and dairy products are destroyed. This has led to a number of people having difficulty in tolerating quark or cottage cheese.

Dairy is an important component in Dr. Budwig's Oil-Protein Diet. Because good substitutes are hard to find, it is worthwhile for those who are lactose intolerant to try different ways of tolerating dairy.

Some possibilities (in no particular order):

- ❑ Use raw milk and raw milk products if you can get them.
- ❑ Use goat's milk instead of cow's milk products.
- ❑ Take the [enzyme Lactase](#) with quark or cottage cheese.

Try Nancy's Cottage Cheese which is made with lactic cultures. For more details, including a store locator, [go to this website](#):

- ❑ Make yogurt quark (recipe under “Foods” in the files)
- ❑ Make kefir quark (straining kefir to get a cream cheese consistency)
- ❑ Get kefir grains, make kefir, remove grains, and strain through fine muslin cloth.

To learn more, do a Google search for “kefir”.

FSO2 member Cheryl du Toit says this about kefir in message #29710: “Kefir cottage cheese (or quark) is most certainly our solution for lactose intolerant people. It works like a charm.”

If one does not wish to make kefir, it can be purchased from the health food store in the refrigerated section. Organic Kefir comes in a liquid and the oil may be stirred into the kefir and consumed. It tastes very good. Make sure the oil is totally dissolved into the kefir before consuming. You may want to check with the health food store and see if they have a kefir cheese similar to cottage cheese which should work, as long as the flax oil blends in and does not float back to the top.

In the case of a person with a feeding tube, one could mix flax oil into the organic kefir by hand as mentioned above. Then pour into the feeding tube. Again, this can be done using ¼ cup kefir to 1 tablespoon of the flax oil and given throughout the day at different times. You may be able to use even a little more oil with the ¼ cup kefir. One may have to play with the mixture to get the desired results. Make sure there is no oil floating on top of the kefir before pouring into the feeding tube.

Dr. Budwig noted prior to administering her protocol she had observed blood analysis of seriously ill cancer patients which showed a strange greenish-yellow substance in the place of the healthy red oxygen carrying hemoglobin. She found their blood, without exception, was deficient in substances called phosphatides and lipoproteins. It has also been found that most people have blood that is 80 percent deficient in Omega 3. Dr. Budwig found that cancer patient’s blood, after three months of using her

protocol, returned to bright red and the tumors began disappearing. Weakness and anemia disappeared and the life energy was restored. Symptoms of cancer, liver dysfunction, and diabetes were completely alleviated.

It has been mentioned in several articles that once a chronic or terminal disease has been brought under control or into remission the amount of flax oil may be reduced to 1 tablespoon per 100 pounds of body weight for maintenance. To prevent reoccurrence of the cancer one should stay on the maintenance dose.

If yogurt is used in place of the cottage cheese it will require three times more yogurt to be consumed than cottage cheese as it lacks the protein density of cottage cheese. Even then, this may not be as effective. There is some question, as Dr. Budwig never addressed this issue. The yogurt will have to be (live cultures, not the kind in the supermarket). An example of using the yogurt would be a  $\frac{3}{4}$  cup of yogurt to 1 tablespoon of flax oil.

The following items listed below should be avoided on this diet.

(The reason one needs to exclude these items from his / her diet is that they interfere with the diet by lowering the voltage field in the cells.)

- Sugar
- All animal fats
- All meats
- Margarine
- Butter
- Salad dressing oils- exception extra virgin olive oil and balsamic vinegar or lemon
- Foods high in Preservatives

Vendors of Flaxseed Oil

Here are two excellent vendors of flaxseed oil:

[Better Way Health](#) (If you purchase Transfer Point Beta Glucan)

[Bio Natures](#) (If you do not purchase Transfer Point Beta Glucan)

## Dr. Budwig Diet Plan

Dr. Budwig has a diet plan that is available in her cookbook, [The Oil Protein Diet Cook Book](#). It can be purchased from [www.amazon.com](http://www.amazon.com) for around \$10.

The following is an example of the protocol given in Dr. Budwig's book.

Most people begin gradually adding healthy foods & liquids and eliminating damaging ones. The diet seems simple, but foods are powerful and can damage or heal a person. This protocol has over a 90 percent success rate, with all kinds of cancer patients, according to Dr. Budwig, and those who studied and reported on her work in Germany over a 50-year period. Many research studies done in the last 10 years support the cancer-fighting value of the foods, juices, sun exposure, and relaxation which Dr. Budwig recommended. There are many testimonials in the files of the FSO2 group written by members who have regained their health by following this protocol after being diagnosed with cancer — many terminal.

To see the files, click here: [To See Files](#)

For diet details see: [Diet Details](#)

The following are some excerpts from the above message link.

To start the diet, it helps to have three appliances. One is a coffee bean grinder to grind the whole brown flaxseeds sold in health food stores or online. In Dr. Budwig's protocol, she used 2-3 tablespoons daily of the ground up flax seed. The flax seeds should be ground and used immediately. They must be consumed

within 15 minutes of grinding or considered rancid. They can be used in cereals, oatmeal, shakes etc.

The 2nd appliance is an immersion hand-held mixer, a somewhat stick-shaped mixer, to blend the flaxseed oil [FO] and the cottage cheese [CC] together so that they become one food, making the oil water-soluble and more absorbable to the cells of the body.

The third appliance needed is a vegetable juicer. A masticating-type may give a more healthful juice than a centrifugal type. Purchasing a vegetable juicer is absolutely essential.

Patients with liver, gallbladder or pancreatic cancer, may need to start with a lesser amount of the oil and build up slowly to Dr. Budwig's recommended dosage. A transitional diet can be found in the FSO2 files or in Dr. Budwig's book.

SUNSHINE — Sun on the skin is very healthful for vitamin D and other benefits but avoid burning. If you feel up to having some exercise, **INDIVIDUALIZE IT ACCORDING TO YOUR STRENGTH NEVER OVERDO IT**. Dr. Budwig did not push the idea of exercise, she felt that one needs rest to heal. So, take caution. [For those who can exercise, besides walking, a rebounder (a small, round trampoline) is beneficial for the lymph system, heart and circulation. **RELAXATION IN THE SUN IF POSSIBLE** to relieve stress is healing – nature, music, chat, laughter. [On days when you cannot be in the sun, high-quality, cold-pressed cod liver oil offers vitamin D and other benefits]

**DR BUDWIG STRESSED THAT IT IS VERY IMPORTANT TO AVOID UNHEALTHY FOODS and SUBSTANCES** such as hydrogenated fats, animal fats, sugar, white flour, preservatives, chemicals and processed foods. Avoid leftovers – food should be prepared fresh and eaten soon after preparation to get the health-giving electrons and enzymes – within 15-20 minutes. At least three times a day drink a warm liquid, such as green or herbal teas, sweeten only with raw honey. Keep a food diary. Avoid stress and anxiety; take time to relax and enjoy each day. Listen to beautiful

music, laugh, do deep breathing, connect with nature, and spend time with people you like. Dr Budwig spoke about the damaging effects of stress.

Also, she did not include supplements or drugs in her protocol. Some supplements, especially high amounts of antioxidants, can interfere with how well the diet works, as can some drugs.

Dr. Budwig in her protocol also used Eldi R Oils and Oil packs to help in the healing process of chronic and terminal diseases. Dr. Budwig created the Eldi Oils (Electron Differentiation oils) through exact spectroscopic measurements via the absorption of light in different oils. The Eldi Oils have a favorable 'retuning' effect on the metabolism for people who are ill. The 'retuning' effect relates to the creation of oxygen and energy within the system. The sun's energy resonates with the electronic energy created by the flax oil and cottage cheese combination, and the Eldi oils do exactly the same when applied topically to the skin or as a rectal enema. When applying in a rectal enema it appeared she used ½ cup to 1 cup of the oils daily. It appears a person would hold the oil for about 15-20 minutes before release. I guess common sense will have to prevail. If Eldi oils are not available one can use flax oil.

The following protocol on how Dr. Budwig used Eldi Oil R was sent to me from Germany by Wolfgang Bloching. The Eldi Oil R is essential in this healing protocol. Wolfgang also advised that Dr. Budwig when necessary used the Eldi Oil R in (Rectal Enemas).

#### Dr. J. Budwig Eldi Oel R (Eldi Oil R): Application

Two times a day, i.e. morning and evening, rub Eldi Oil R into the skin over the whole body, a bit more intensively on the shoulders (armpits), breast and groin (where the lymphatic vessels are) and also on the problem areas, like for instance the breast, stomach, liver, etc. Leave the oil on the skin for about 15-20 minutes. Then take a warm shower without soap. Then follow up with another shower, this time using a mild soap. Then rest for 15-20 minutes.

The purpose of the shower, after the body has been oiled and the Eldi Oil has penetrated the skin, is that the warm water opens the pores so that the oil can penetrate a bit deeper into the skin. The second shower, this time with soap, is for skin surface cleaning so that clothes and linen will not become soiled too much.

Always use the Eldi Oil R in connection with the Oil-Protein Diet (Budwig Diet) and do this consistently, even if it seems difficult at times. The Oil-Protein Diet together with Eldi Oil is a helpful method to improve problems and illnesses long term. The Eldi Oils in small bottles with 95 ml content are all perfumed and contain, like Eldi Oil R, only highly unsaturated fatty acids, but they are too expensive to be used for the whole body. They are meant to be used this way for example:

Eldi Oel photo activ (photo active) only for the face.

Eldi Oel Rose for a woman's body (rose oil).

Eldi Oel herb neu (tart new) for a man's body (tart scent).

Eldi Oel H-activ (H-active) only for the breast region (heart) etc.

Eldi Oel balsamicum Salbei (balsamic sage) is only for oil packs. Take pure cotton 100 percent or a cotton cloth. Cut these to size for the body part, for example, the knee. Soak the cotton, place on the knee, cover the cotton with a plastic sheet and wrap it all with an elastic bandage. Leave it on for the night. Remove it in the morning and wash the knee. Repeat it in the evening and do this for weeks. You can also use Eldi Oil R for these local applications. The oil pack is only suited for local problems (no metastases).

Only three of Dr. Budwig's books have been translated from German into English at this time. For more information on where to purchase Dr. Budwig's books check out the websites below. It was very difficult to find the newly released third book.

Flax Oil As A True Aid Against Arthritis, Heart Infarction, Cancer And Other Diseases – Can be purchased from Amazon.com

To Order

I hope the information provided will help you or a loved one. For further information, I would highly recommend the <http://health.groups.yahoo.com/group/FlaxSeedOil2/files/>. They have accumulated some of the best information in the world on Dr. Budwig's Protocol and may be able to answer most any question you may have.

onsanto originated in St. Louis in 1901, with John F. Queeny producing an artificial sweetener, saccharin. From 1903 to 1905, Monsanto's entire saccharin output was shipped to Atlanta (saccharin was one of the secret ingredients in original Coca-Cola).

Named after Queeny's wife, Olga Mendez Monsanto, the company eventually expanded to other products such as caffeine and aspirin, as well as synthetic rubbers and fibers.

Sports fans are familiar with the most popular synthetic fiber use — AstroTurf, patented by Monsanto in 1965 and originally sold under the name “ChemGrass.” It was re-branded after it was installed as the playing field at the Houston Astrodome in 1966.

Queeny

Now, Monsanto is one of the “Big 6” biotech corporations — along with BASF, Bayer, Dow Chemical, Dupont, and Syngenta. They dominate the world's seed, pesticide, and biotechnology industries.

Monsanto is the mother of agricultural biotechnology. The company produces biotechnology, genomics, and herbicides for corn, cotton, oil seeds, and vegetables. It also produces genetically-altered seeds to tolerate it's most notable product, Roundup. Other products manufactured under the Monsanto umbrella have included:

- Agent Orange — The U.S. military sprayed millions of gallons of Agent Orange — a mixture of two herbicides (2,4-D and 2,4,5-T) — and other herbicides on trees and vegetation during the Vietnam War. From 1965 to 1969, Monsanto Company was one of nine wartime government contractors that manufactured Agent Orange. Decades later, concerns about the health effects from these chemicals continue.
- Polychlorinated biphenyls — PCBs are manufactured organic chemicals that contain 209 individual chlorinated chemicals (known as congeners). There are no known natural sources of PCBs. Some commercial PCB mixtures are known by their industrial trade name, Aroclor. The manufacturing of PCBs stopped in the U.S. in 1977 because of evidence that they build up in the environment and cause harmful health effects
- Dichloro Diphenyl Trichloroethane — DDT was developed in the 1940s as the first of the modern synthetic insecticides. It was initially used to combat malaria, typhus, and the other insect-borne human diseases. It also was effective for insect control in crop and livestock production, institutions, homes, and gardens.
- Recombinant Bovine Growth Hormone — In order to increase milk production, Monsanto developed genetically engineered rBGH. The FDA approved the synthetic hormone use in 1993, and today about a third of U.S. dairy

cows are injected with rBGH, which boosts milk production by about 10 percent. The World Health Organization, the FDA and numerous medical associations believe milk from rBGH-treated cows is safe — but many nations have banned rBGH, including all 25 European Union nations, Japan, Australia, New Zealand, and Canada.

- Aspartame — FDA approved aspartame in 1981 for uses, under certain conditions, as a tabletop sweetener, in chewing gum, cold breakfast cereals, and dry bases for certain foods. In 1983, the FDA approved the use of aspartame in carbonated beverages and carbonated beverage syrup bases, and in 1996, it was OK'd for use as a “general purpose sweetener.” A study in the American Journal of Industrial Medicine, which treated six groups of mice with aspartame from before their birth until their deaths, found that this toxic artificial sweetener induces cancers of the liver and lungs in male mice.

### Dr. Thomas

In 1926, Dr. Charles Thomas and an associate, Dr. Carroll A. Hochwalt, formed an independent laboratory in Dayton, Ohio. The laboratory did wide-ranging research, from developing a synthetic rubber to devising smoked salt for the curing of hams and bacon, and attracted attention for its creativity.

One of those who took notice was Queeny's son Edgar, the president Monsanto with a reputation for snatching up companies (and their talent). Monsanto bought Thomas and Hochwalt Laboratories, and not long after Dr. Thomas was drawn into

wartime research. By 1940 he had developed a synthetic resin that was supplied to the British to sabotage their gasoline supplies if the Germans mounted a successful invasion.

In 1943, the Manhattan Engineer District tasked Dr. Thomas (and Monsanto) with separating and purifying the radioactive element Polonium, which was to be used as the initiator for the atomic bombs. (Yes, Monsanto was a key player in the Manhattan Project, which ushered in the nuclear age.)

Dr. Thomas was named to Monsanto's board of directors in 1942 and became a vice president the next year. By 1947 he was executive vice president. Dr. Thomas became president in 1950 and was named the chairman of the board in '60. He retired in 1970. It was this 30-year stretch of growth for Monsanto that laid the groundwork for today's leading biotech behemoth.

During the time Thomas and Hochwalt Laboratories began making a name for itself, a farmer in Arkansas was actively promoting soybeans to growers. Jacob Hartz and Alfred Ralph Thorell formed Hartz-Thorell Supply Co., a McCormick-Deering dealership, in 1925.

Hartz founded Jacob Hartz Seed Co. as a division of Hartz-Thorell Supply Co. In 1927, Hartz-Thorell owned the first seed cleaner in Arkansas, and in 1936, the company built its first seed processing plant. The Hartz-Thorell partnership dissolved in 1942, and Hartz became president of Jacob Hartz Seed Co. Forty years later, it would be a key acquisition for a burgeoning biotech company.

Monsanto launched its Agricultural Division in 1960. Ramrod, a herbicide that inhibits cell division, was released in 1964, followed by Lasso in '68, and Roundup in 1976.

Inside Knowledge

Did You Know?

A \$22 million award to an internal whistle-blower at Monsanto is a good example of the impact an internal whistle-blower can have in showing the Securities and Exchange Commission where there may be problems inside a company.

Monsanto in February settled charges of violating accounting rules related to the recording of the costs of a rebate program for Roundup, one of its leading consumer products. The company offered rebates to its distributors to increase sales but shifted those costs into the next fiscal year. By not recognizing the expenses right away, it was able to push up its revenue while delaying the reduction caused by recognizing the costs, something that investors would certainly want to know in evaluating how a company is doing.

Accounting shenanigans are notoriously difficult to uncover, especially for a company like Monsanto, which has annual sales of more than \$10 billion and multiple product lines. The amount of the rebates was comparatively small, less than \$100 million over two years, so it is unlikely it would have been noticed by the SEC without a whistle-blower saying where to look.

— *The New York Times*

'Probably carcinogenic to humans'

While Monsanto was promoting its game-changing biochemical products, it was hiding a life-changing secret.

From *The Washington Post* on Jan. 1, 2002:

*In 1966, Monsanto managers discovered that fish submerged in that creek turned belly-up within 10 seconds, spurting blood and shedding skin as if dunked into boiling water. They told no one. In 1969, they found fish in another creek with 7,500 times the legal PCB levels. They decided "there is little object in going to expensive extremes in limiting discharges." In 1975, a company study found that PCBs caused tumors in rats. They ordered its*

*conclusion changed from “slightly tumorigenic” to “does not appear to be carcinogenic.”*

*Monsanto enjoyed a lucrative four-decade monopoly on PCB production in the United States, and battled to protect that monopoly long after PCBs were confirmed as a global pollutant. “We can't afford to lose one dollar of business,” one internal memo concluded.*

In the trial of *Owens v. Monsanto* on April 4, 2001, the company's lawyers acknowledged only one health threat posed by exposure to PCBs: chloracne, a serious skin condition. However, [a 1996 study by the U.S. Environmental Protection Agency](#) found that “occupational studies show some increases in cancer mortality in workers exposed to PCBs” and “significant excess mortality from cancer of the liver, gall bladder, and biliary tract in capacitor manufacturing workers exposed to Aroclors 1254, 1242, and 1016.”

The study noted, “Based on these findings, some commercial PCB mixtures have been characterized as probably carcinogenic to humans.”

In 2003, more than 20,000 plaintiffs in federal and state trials reached a \$700 million settlement to resolve all outstanding Anniston, [Ala.](#), PCB litigation. The agreement included \$600 million in cash payments. Costs for cleanup, prescription drug, and other programs put the total past \$700 million. Monsanto agreed to pay \$390 million, while Solutia was to pay \$50 million over 10 years in equal annual installments. The remaining \$160 million would be provided through Monsanto's, Solutia's and Pharmacia Corporation's commercial insurance.

The jury found that “Monsanto had engaged in outrageous behavior, and held the corporations and its corporate successors liable on all six counts it considered — including negligence, nuisance, wantonness and suppression of the truth.”

Solutia, which was formed as a divestiture of Monsanto, filed for bankruptcy on Dec. 17, 2003, citing litigation, unsustainable debt structure, and a downturn in the economy. Solutia emerged from bankruptcy on February 2008 and was bought by Eastman Chemical Company in 2012 for \$4.8 billion.

Today, Monsanto makes note that it is focused on agriculture, distancing itself from its sordid past in the chemical business. However, it remains indemnified with Pharmacia and Solutia.

‘A product of human ingenuity’

*Diamond v. Chakrabarty* was a U.S. Supreme Court case in 1980 that dealt with whether genetically modified organisms can be patented. It was genetic engineer Ananda Chakrabarty’s “product of human ingenuity” that ultimately set in motion a collision course between GMOs and Monsanto.

Chakrabarty, while working for General Electric, filed a patent for a genetically modified bacterium capable of breaking down multiple components of crude oil. However, the application was rejected; under patent law at that time, living things were generally understood to not be patentable under Section 101 of Title 35 U.S.C.

In a 5-4 decision, the Supreme Court ruled in favor of Chakrabarty, holding that “A live, human-made micro-organism is patentable subject matter under 35 U.S.C. § 101. Respondent’s micro-organism constitutes a ‘manufacture’ or ‘composition of matter’ within that statute.” Chief Justice Warren Burger judged that Chakrabarty’s “micro-organism plainly qualifies as patentable subject matter. His claim is ... to a non-naturally occurring manufacture or composition of matter — a product of human ingenuity.”

“Monsanto should not have to vouchsafe the safety of biotech food. Our interest is in selling as much of it as possible. Assuring its safety is the FDA’s job.”

Phil Angell

Former dir. of corporate communications

In 1982, the Jacob Hartz Seed Co. was acquired by Monsanto, and its scientists became the first to genetically modify a plant cell. Five years later, Monsanto conducted the first U.S. field trials of plants with biotechnology traits.

Monsanto bought the plant biotechnology assets of Agracetus in 1996 and purchased biotech research company Calgene a year later. Calgene had put the first consumer GMO fruit on grocery shelves in 1994 — the Flavr Savr, a delayed-ripening tomato that had a longer shelf life than conventional tomatoes.

Continuing to push its biotech agribusiness, Monsanto also introduced Roundup Ready Soybeans in 1996, a bioengineered seed that provided farmers with in-seed herbicide tolerance to Roundup and other glyphosate-based herbicides. Roundup Ready Canola and Roundup Ready Cotton hit the market the next year.

While GMOs were becoming part of the agricultural vernacular in the late 1990s, Phil Angell, Monsanto's director of corporate communications in 1998, famously declared: “Monsanto should not have to vouchsafe the safety of biotech food. Our interest is in selling as much of it as possible. Assuring its safety is the FDA's job.”

About Monsanto and the FDA ...

Jeffrey Smith, the author of *Seeds of Deception* and *Genetic Roulette*, has documented the health risks of GMOs. His Institute for Responsible Technology launched a campaign for healthier eating,

designed to achieve the tipping point of consumer rejection of GMOs to force them out of the food supply.

The IRT went nose to nose with Monsanto over Recombinant Bovine Growth Hormone (rBGH), and produced the documentary Your Milk on Drugs — Just Say No! Among the information uncovered:

- An FDA scientist who demanded more safety studies on rBGH, but was fired for holding up its approval.
- A FOX TV investigative reporter whose news series linking rBGH to cancer was canceled after the station received letters from Monsanto's attorney threatening “dire consequences for Fox News.”
- Canadian government scientists who wrote a scathing critique of the FDA's flawed and biased evaluation of rBGH, and then testified about political pressure, stolen evidence, and an alleged bribe offer from Monsanto.
- Rigged research from the drug's maker, meticulously designed to cover up health problems.
- A scientist who did rBGH research for Monsanto, and then became the drug's lead reviewer at the FDA.
- Michael Taylor, Monsanto's former attorney, was in charge of FDA policy when rBGH was approved. He later was a Monsanto vice president (1996-2000) before returning to the FDA. In 2010 he was appointed the deputy commissioner for foods.
  
- *Also: The World According to Monsanto*

Monsanto created rBGH to stimulate milk production in cows. The use of rBGH stimulates the production of insulin-like growth factor 1 (IGF-1), a naturally occurring hormone in both cows and humans that regulates cell growth, division, and differentiation. Cow's milk that is treated with rBGH has higher levels of IGF-1. In addition to breast cancer, increased IGF-1 levels have been associated with prostate, colon, and other cancers.

In 2007, Dr. Samuel Epstein exposed the dangers of rBGH in *What's in your Milk?* This book reveals the science, politics, and corporate greed behind the creation and approval of rBGH. Since then, many milk producers have decided to sell only rBGH-free milk. Monsanto also sold its rBGH business unit (Posilac) to Eli Lilly in 2008.

## The Monsanto GMO monolith

Roundup remains Monsanto's bell cow in the consumer marketplace. However, the herbicide is under increased scrutiny. A study published in *Biomedical Research International* shows that Roundup is 125 times more toxic than its active ingredient glyphosate studied in isolation. Roundup also was linked to cancer recently by the WHO:

*There is convincing evidence that glyphosate also can cause cancer in laboratory animals. On the basis of tumors in mice, the United States Environmental Protection Agency (US EPA) originally classified glyphosate as possibly carcinogenic to humans. A US EPA report and several more recent positive results conclude that there is sufficient evidence of carcinogenicity in experimental animals. Glyphosate also caused DNA and chromosomal damage in human cells, although it gave negative results in tests using bacteria. One study in community residents reported increases in blood markers of chromosomal damage (micronuclei) after glyphosate formulations were sprayed nearby.*

While diverging from a chemical company to an agribusiness / biotech model, Monsanto has gobbled up, among others: Holden's Foundation Seeds, Corn States Hybrid Service, DeKalb Genetics Corp., Channel Bio Corp., Fontanelle Hybrids, Stewart Seeds, Trelay Seeds, Stone Seeds, Specialty Hybrids, NC+ Hybrids, Stoneville, Seminis, Diener Seeds, Sieben Hybrids, Kruger Seed Company, Trisler Seed Farms, Gold Country Seed, Heritage Seeds,

Campbell Seed, De Ruiter Seeds Group, Semillas Cristiani Burkard, Aly Participacoes Ltda., Beeologics, and Divergence.

In 2007, Monsanto formed International Seed Group, an investment holding company that provides specialized, regional vegetable and fruit seed companies with access to capital and technology.

According to Food and Water Watch, Monsanto held an overwhelming monopoly on the seed market in 2013:

- 95 percent of the U.S. GE corn seed market containing Monsanto's traits.
- 93 percent of U.S. soy grown from Monsanto-patented GMO seeds.
- 89 percent of the U.S. GE cotton seed market containing Monsanto's traits.
- 80 percent of U.S. corn grown from Monsanto-patented GMO seeds.
- 27 percent of Monsanto profits came from the sale of Roundup herbicide.
- 1,676 — number of seed, plant, and other applicable patents owned by Monsanto.
- 282 million — number of acres Monsanto products are grown worldwide (up from 3 million in 1996).
- 151.4 million — number of acres Monsanto's GE crop traits are grown in the U.S. (40 percent of total cropland).

Monsanto cornered the markets on genetically-modified corn, cotton, soybean, and sugarcane through its biotechnologies. It also spent millions on lobbying Congress to protect its patent-seed business. ... If history repeats itself, it's merely a matter of time before those "specialized, regional vegetable and fruit seed companies" become part of the Monsanto GMO monolith.

On Sept. 14, Bayer announced it has offered \$66 billion to take over Monsanto. The companies now must get the merger past

regulators around the globe. If regulators nix the transaction, Bayer has agreed to pay \$2 billion to Monsanto.

Fat, Sick and Nearly Dead is a 2010 American documentary film which follows the 60-day journey of Australian Joe Cross across the United States as he follows a juice fast to regain his health under the care of Dr. Joel Fuhrman, Nutrition Research Foundation's Director of Research. Cross and Robert Mac, co-creators of the film, both serve on the Nutrition Research Foundation's Advisory Board. Following his fast and the adoption of a plant-based diet, Cross states in a press release that he lost 100 pounds and discontinued all medications. During his road-trip Cross meets Phil Staples, a morbidly obese truck driver from Sheldon, Iowa, in a truck stop in Arizona and inspires him to try juice fasting. A sequel to the first film, Fat, Sick and Nearly Dead 2, was released in 2014
